# Sinclair ZX81 Personal Comp the heart of a system that grows with you.

1980 saw a genuine breakthrough – the Sinclair ZX80, world's first complete personal computer for under £100. Not surprisingly, over 50,000 were sold.

In March 1981, the Sinclair lead increased dramatically. For just £69.95 the Sinclair ZX81 offers even more advanced facilities at an even lower price. Initially, even we were surprised by the demand – over 50,000 in the first 3 months!

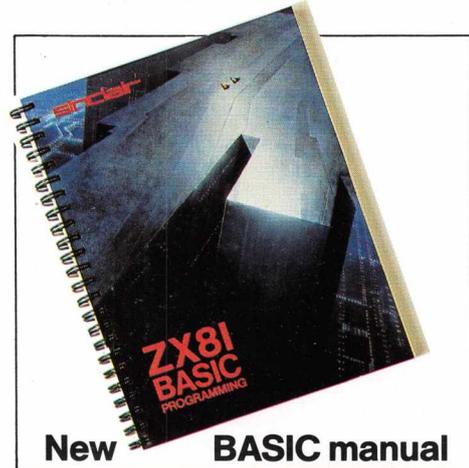

Today, the Sinclair ZX81 is the heart of a computer system. You can add 16-times more memory with the ZX RAM pack. The ZX Printer offers an unbeatable combination of performance and price. And the ZX Software library is growing every day.

## Lower price: higher capability

With the ZX81, it's still very simple to teach yourself computing, but the ZX81 packs even greater working capability than the ZX80.

It uses the same micro-processor, but incorporates a new, more powerful 8K BASIC ROM – the 'trained intelligence' of the computer. This chip works in decimals, handles logs and trig, allows you to plot graphs, and builds up animated displays.

And the ZX81 incorporates other operation refinements – the facility to load and save named programs on cassette, for example, and to drive the new ZX Printer.

New BASIC manual

Every ZX81 comes with a comprehensive, specially-written manual – a complete course in BASIC programming, from first principles to complex programs.

## Kit: £49.<sup>95</sup>

### Higher specification, lower price – how's it done?

Quite simply, by design. The ZX80 reduced the chips in a working computer from 40 or so, to 21. The ZX81 reduces the 21 to 4!

The secret lies in a totally new master chip. Designed by Sinclair and custom-built in Britain, this unique chip replaces 18 chips from the ZX80!

### New, improved specification

- Z80A micro-processor – new faster version of the famous Z80 chip, widely recognised as the best ever made.
- Unique 'one-touch' key word entry: the ZX81 eliminates a great deal of tiresome typing. Key words (RUN, LIST, PRINT, etc.) have their own single-key entry.
- Unique syntax-check and report codes identify programming errors immediately.
- Full range of mathematical and scientific functions accurate to eight decimal places.
- Graph-drawing and animated-display facilities.
- Multi-dimensional string and numerical arrays.
- Up to 26 FOR/NEXT loops.
- Randomise function – useful for games as well as serious applications.
- Cassette LOAD and SAVE with named programs.
- 1K-byte RAM expandable to 16K bytes with Sinclair RAM pack.
- Able to drive the new Sinclair printer.
- Advanced 4-chip design: micro-processor, ROM, RAM, plus master chip – unique, custom-built chip replacing 18 ZX80 chips.

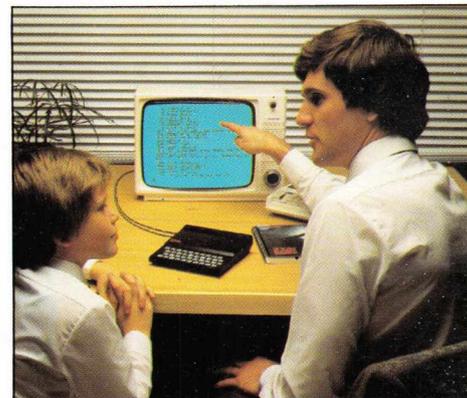

## Built: £69.<sup>95</sup>

### Kit or built – it's up to you!

You'll be surprised how easy the ZX81 kit is to build: just four chips to assemble (plus, of course the other discrete components) – a few hours' work with a fine-tipped soldering iron. And you may already have a suitable mains adaptor – 600 mA at 9 V DC nominal unregulated (supplied with built version).

Kit and built versions come complete with all leads to connect to your TV (colour or black and white) and cassette recorder.

# puter-

## Available now- the ZX Printer for only £49.<sup>95</sup>

Designed exclusively for use with the ZX81 (and ZX80 with 8K BASIC ROM), the printer offers full alpha- numerics and highly sophisticated graphics.

A special feature is COPY, which prints out exactly what is on the whole TV screen without the need for further instructions.

**How to order your ZX81**  
BY PHONE – Access, Barclaycard or Trustcard holders can call 01-200 0200 for personal attention 24 hours a day, every day.  
BY FREEPOST – use the no-stamp-needed coupon below. You can pay

At last you can have a hard copy of your program listings – particularly useful when writing or editing programs.

And of course you can print out your results for permanent records or sending to a friend.

Printing speed is 50 characters per second, with 32 characters per line and 9 lines per vertical inch.

The ZX Printer connects to the rear of your computer – using a stackable connector so you can plug in a RAM pack as well. A roll of paper (65 ft long x 4 in wide) is supplied, along with full instructions.

by cheque, postal order, Access, Barclaycard or Trustcard.  
EITHER WAY – please allow up to 28 days for delivery. And there's a 14-day money-back option. We want you to be satisfied beyond doubt – and we have no doubt that you will be.

## 16K-byte RAM pack for massive add-on memory.

Designed as a complete module to fit your Sinclair ZX80 or ZX81, the RAM pack simply plugs into the existing expansion port at the rear of the computer to multiply your data/program storage by 16!

Use it for long and complex programs or as a personal database. Yet it costs as little as half the price of competitive additional memory.

With the RAM pack, you can also run some of the more sophisticated ZX Software – the Business & Household management systems for example.

# THREE PET TITLES

## from

# Nick Hampshire

### LIBRARY OF PET SUBROUTINES

A book which will save the software designer considerable time by providing 55 proven subroutines to integrate with his own programmes.

Each subroutine is preceded by a page of general information describing its purpose and implementation and possible problems that may arise. Basic, machine language and a combination of both, are used throughout this publication.

"... We like this book very much and thoroughly recommend it."

*Printout*

"... well prepared, fun to use, and will help in better program development."

*Compute*

### THE PET REVEALED

A reference book which details everything you need to know about the workings of the PET. Containing information helpful to writing more elaborate programmes, which in turn create more interesting functions.

"... Should be congratulated. Supplies some much needed, useful and correct documentation."

*Compute*

"... 'PET Revealed' will save you an awful lot of time. I rate this book as good value for money."

*Printout*

All 3 publications are widely used by Commodore Business Machines.

### PET GRAPHICS

This book has two objectives. One, to provide the reader with an introduction to the programming techniques used to generate graphic displays.

Two, providing the programmer with a complete package of machine code routines giving a wide range of normally unavailable graphic functions. The book contains many comprehensively analysed routines and photographs to illustrate the effects created.

"... an invaluable guide to graphics on the PET."

*Micro Forecast*

#### Please send me:

## New from Sams

# Six COMMODORE SUPERPET COMPUTERS Books

## Using Waterloo microSoftware

### Available this month

F. D. Boswell, T. R. Grove, K. I. McPhee, J. B. Schueler and J. W. Welch

### System Overview

This introduction to the Commodore SuperPET personal computing system provides an overview of the hardware and of the Waterloo microSoftware packages.

£4.15 672-21903-4

P. H. Dirksen and J. W. Welch

### Waterloo microFORTRAN

*Tutorial and Reference Manual*

Waterloo microFORTRAN is a dialect of FORTRAN designed for use in educational and research environments. This book introduces the many features of Waterloo microFORTRAN step by step, placing emphasis on the detection and diagnosis of errors.

£7.65 672-21904-2

F. D. Boswell, T. R. Grove and J. W. Welch

### Waterloo microPascal

*Tutorial and Reference Manual*

The Tutorial gives a quick introduction to Pascal while the Reference Manual provides a concise definition of the language. Waterloo microPascal is an interpretive implementation of Pascal. It is accompanied by Waterloo microEdit—a full-screen text editor.

£7.65 672-21905-0

### Future titles

J. Wesley Graham and K. I. McPhee

### Waterloo microBASIC

*Tutorial and Reference Manual*

£7.65 672-21906-9 March

D. D. Cowan and M. J. Shaw

### Waterloo 6809 Assembler

*Tutorial and Reference Manual*

£7.65 672-21908-5 March

J. C. Wilson and T. A. Wilkinson

### Waterloo MicroAPL

*Tutorial and Reference Manual*

£6.95 672-21907-7 April

Prices and publication dates are correct at the time of going to press but may be subject to change. All titles advertised are published as spiral-bound paperback books.

# POWER

Professional Software Introduces

**POWER**

by Brad Templeton

## ADD POWER TO YOUR COMMODORE COMPUTER

**£49**  
+ VAT

POWER produces a dramatic improvement in the ease of editing BASIC on Commodore's computers. POWER is a programmer's utility package (in a 4K ROM) that contains a series of new commands and utilities which are added to the Screen Editor and the BASIC Interpreter. Designed for the CBM BASIC user, POWER contains special editing, programming, and software debugging tools not found in any other microcomputer BASIC. POWER is easy to use and is sold complete with a full operator's manual written by Jim Butterfield.

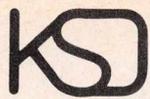

POWER's special keyboard 'instant action' features and additional commands make up for, and go beyond the limitations of CBM BASIC. The added features include auto line numbering, tracing, single stepping through programs, line renumbering, and definition of keys as BASIC keywords. POWER even includes

new "stick-on" keycap labels. The cursor movement keys are enhanced by the addition of auto-repeat and text searching functions are added to help ease program modification. Cursor UP and cursor DOWN produce **previous** and next lines of source code. COMPLETE BASIC program listings in memory can be displayed on the screen and scrolled in either direction. POWER is a must for every serious CBM user.

Call us today, for the name of the Professional Software dealer nearest you.

# Eagle Eye

## The Database Management and Information Retrieval System For CP/M\* Microsystems

- Mainframe retrieval power at micro cost using internationally accepted EURONET Command Language.
- Sets new standards in clarity of instructions. Entire system is menu driven to make it really friendly to users, experienced or otherwise.
- Design and update your own database with over 50 searchable terms and relocate any record by any combination of terms.
- Each record can be up to 472 characters. Each database up to 8 megabytes. Typical retrieval time is 6 seconds using any term in 10,000 records.

Search results can be viewed, printed or filed for subsequent processing into any format which makes Eagle Eye ideal for custom built information systems, mailing lists, personnel records, cataloguing, market research, sales management, medical and veterinary records, correspondence filing, customer profiles, product lists, price lists, project research, insurance client records, legal research, enquiry services for libraries, museums, sales promotion, recruitment etc., etc., etc.

Eagle Eye is available from Leading Software Dealers or direct from

# PET SPEED

## Life in the fast lane

If you're thinking of buying a Basic Compiler let us first show you exactly what we mean by 'Life in the fast lane'.

Oxford Computer Systems (Software) Ltd., suppliers of the first Basic Compiler for the Pet, have prepared an enlightening demonstration disk giving direct speed comparisons between Pet Basic, Petspeed and the alternative Basic Compiler.

Petspeed is the only **optimising** Basic Compiler available for any microcomputer, which is only one of its **other** advantages.

**FASTER** – Petspeed is capable of double the speed of the DTL Basic Compiler and up to 40 times the speed of Pet Basic.

**SHORTER PROGRAM SIZE** – the size of long programs is considerably reduced.

**COMPATIBLE** – Petspeed will compile ANY Pet Basic program.

**OPTIMISATION** – Petspeed is the only optimising Basic Compiler available for any microcomputer, because of its optimisation, programs run much faster.

**SECURITY** – Your programs belong to YOU. Oxford Computer Systems (Software) Ltd. makes no claim on Petspeed Compiled programs. No dongle or security device is required for compiled programs and users can build in their own protection. Petspeed code is unlistable and compiled programs cannot be tampered with.

**PRICE** – we will leave you to compare prices.

Also available **COMPILED INTEGER BASIC** – 150 to 200 times the speed of Basic Compiled. Compiled Basic is for those applications where the speed of the machine is required without the inconvenience of assembly level programming. Ideal for scientific and educational users. Compatible with Petspeed.

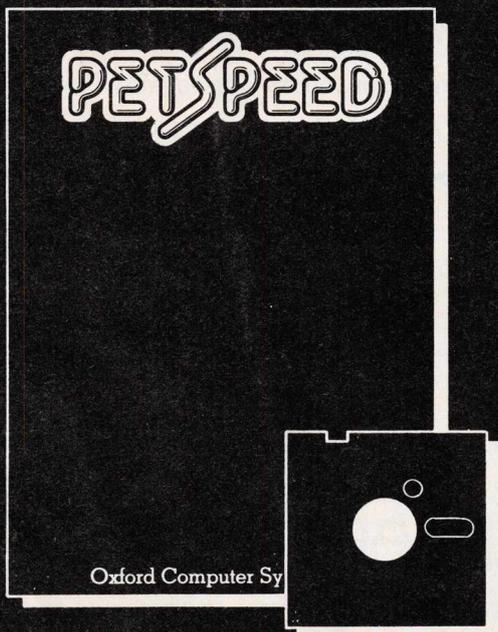

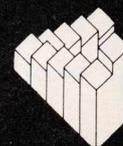

**Petspeed** for 8000 series ..... £240  
**Compiled Basic** ..... £165

**Special Offer:** Petspeed for 8000 series PLUS Compiled Basic for just £320.

Write or phone today for a free copy of the 'Life in the fast lane' demonstration disk.

**Oxford Computer Systems (Software) Ltd.**  
 7 & 8 Park End Street, Oxford OX1 1HH  
 Telephone Oxford (0865) 49597

# 4 & 4 ROM PAGER

## FOR CBM/PET™

Following the success of our 8-slot ROM PAGER, we now introduce a 4 plus 4 ROM PAGER.

This Pager enables you to select from up to four different ROMs, in any two adjacent blocks of PET's memory. All common program or utility ROMs or EPROMs can be used.

Each row of 4 ROMs is under separate software control, so you can choose which ROMs you want with single 'poke' commands. Even from within your programs.

For users who already have extra loading on their PET power supply, or who are using ROMs that consume a lot of power, we have included space on the printed circuit board for separate power supply components.

8 slot ROM Pager.....£45.00  
 4 plus 4 ROM Pager.....£47.50  
 VAT extra, Postage Free.

### Other Products.....

Business Disk, Business ROM, EPROM programmer, Assemblers, etc.

Most of our products are Commodore Approved.

**Further information and catalogues available free. Demonstrations/Advice with pleasure.**

## BRITISH BROADCASTING'S COMPUTER

The BBC micro looks like remarkable value for money, but is it easy enough for a beginner to use? Our chief Boffin, Tommy, joined beginner, Chris Heaton, for a unique joint review of the first production machine.

**BBC 1**

**BBC 2**

**ITV 1**

**ITV 2**

**COMPUTER**

**TOMMY:** Hello again readers! It is nice to be let out of my column occasionally to be allowed to write a real article, or at least half an article. I hope my typing finger can stand the strain. The idea of this review is to look at the new BBC micro, from the makers of the Acorn Atom. This machine is being produced as part of a 'Computer Literacy Project' run by the BBC to help Joe Public to understand how computers work and how they can help around the home. My partner in crime is a friend of mine who has been thinking about buying a computer ever since they first began printing pictures of Raquel Welch. When my dear editor (may his camel never thirst) suggested we get what he so sweetly calls 'a typical man-in-the-street' to play with the new BBC micro to see just how easy it is, I thought 'What we really want is a complete and utter idiot'.

**CHRIS:** I think I had better introduce myself to start with. My name is Chris Heaton, an old schoolchum of Tommy's from years ago. I have been interested in home computing for quite a while, but have not actually got around to laying out any money on one yet. I had a look at the Sinclair ZX81 computer, and I was about to write a cheque when Tommy said that I ought also to look at the new machine from Commodore, the VIC, so I spent a most enjoyable morning with Tommy at one of our local dealer's premises. I had just saved up the extra when this BBC micro came along. I must say, I don't like the way each of Tommy's suggestions is a bit more expensive than the last!

Tommy was most insistent that I should play with the machine on my own, with the absolute minimum of assistance, so that we could decide how easy it would be for a dummy like wot I am to learn how to use it. So, feeling very nervous, I opened the box and unpacked it.

My first reaction was that it was much bigger than I expected. As I said, I have played with ZX81s etc., but this is larger than the VIC. It still felt very comfortable on my lap in front of the telly, so the size should not be a problem. It is still a good bit smaller than any of the computers in Tommy's junk-room. Also in the box were several cables, two booklets and a program cassette. I was about to plug the computer into the mains when Tommy stopped me, and said that the first rule I had to learn was that I ought to read the manual before I tried out the equipment. He also said that it would be a good idea if the computer, television and cassette recorder were reasonably close together. I left him re-arranging my living room, much to the disgust of my fat old tabby.

I started with a slim volume, helpfully entitled 'WELCOME', which seemed a good place to start. This started with a detailed description of how to connect the computer to the TV, with lots of photos, like those DIY car manuals, and then explained the meanings of the various keys on the keyboard. This was followed by a couple of short programs for me to key in, and pictures of the displays they would produce. These

did not make much sense, but I did recognise some words like DRAW and PLOT. Then followed another series of photographs explaining how to connect the cassette recorder, and a section describing each of sixteen programs on the free cassette. The booklet ended with a message from the BBC Computer Literacy Project Editor, a Mr. David Allen. Is he any relation I wonder?

While I had been engrossed in the "Welcome" booklet, Tommy had been dipping into the other booklet, which he said was a BASIC reference manual, and the beer in my fridge. I said that we ought to get started while he could still type, and he agreed.

It was left to me (again) to work out how to connect the computer to the TV. Despite my two left hands, it was extremely straightforward. All you have to do is connect one end of a cable to the computer, plug the other end into the aerial socket of the TV, and you are in business. You have to adjust the tuning on the TV, because the computer acts like another TV station, but most sets have plenty of spare buttons, one of which can be used for the computer without disturbing the existing settings.

The cat had hardly fallen asleep again before I was proudly showing Tommy the results of my first program copied from the "WELCOME" booklet. It was only four lines long, and drew a series of random shapes of different colours on the screen, but at least it worked!

**TOMMY:** As Chris has told you, the documentation supplied with the BBC micro is of a high standard. In fact, as our machine was a pre-release model for review, we did not have the full range of manuals, only the simple introduction which Chris described, and a BASIC language reference manual. This does devote several chapters at the start to elementary programming, but the bulk of the learning material was not available, and is intended to be used in conjunction with the television series.

The reference section of the manual is very clear, giving one page to each BASIC statement and function, explaining

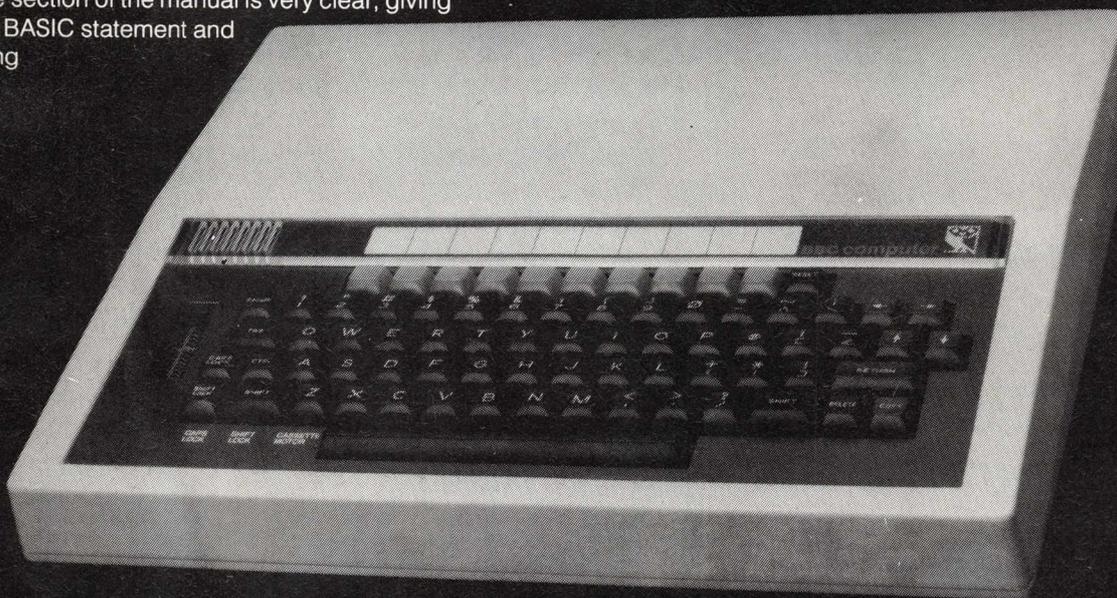

the meaning of each and giving several examples. One feature which I have not seen before is that every page contains a list of 'related words' to be used as a cross-reference. For example the page for GOSUB also mentions RETURN and ON; FOR mentions TO, STEP and NEXT. This is especially useful for a beginner who is not quite sure if he has the right word; he can look up similar words and check their entries.

I do have one slight gripe, and that is that the cables could do with being a little bit longer; Chris' TV and hi-fi are not really far apart, but the cables were just not quite long enough.

**CHRIS:** The time had come to connect the cassette, and here we ran into our first snag. Two cables are supplied: one ending in a 5-pin DIN plug, the other in bare wires. As my recorder uses phono plugs, we had a problem. The advice given by the "WELCOME" booklet was to go to a hi-fi dealer, who would put plugs on for us. Fortunately, Tommy is a dab hand with a soldering iron, and after dashing back to his house for his bits and pieces (and some more beer!) he managed to rig up a cable for me.

The first program on the tape is recorded ten times over. The idea is to allow you to experiment with the volume and tone controls on your recorder to achieve the best results. In my case, the program loaded first time with the controls still set as for normal listening, so by the time the tenth program had loaded successfully and told me that my recorder was properly adjusted, I was beginning to get a bit tired with it!

The first real program was a 'typing test'. The computer displays a character on the screen, and you have to press that character as quickly as you can. The machine tells you if you are right, and tells you your reaction time. At the end of the test the computer tells you your score. Mine was not really very good, but by the end of it, I knew how to find most of the "special" keys which are not on my typewriter. ▶

# When your Apple's off-line, use the printer for typing!

## SCRIPTA\* £998 + VAT (RO Version £836 + VAT)

SCRIPTA is a unique printer.

When you're not using it as a data terminal, one switch will turn it into a daisywheel typewriter. Which means you need buy only one machine instead of two.

SCRIPTA was ergonomically designed by Europe's largest office equipment manufacturer – and continuity of supply, maintenance and spares is guaranteed.

SCRIPTA gives the finest letter quality printout on single and multi-part forms or letterheads with optional tractor and sheet feeders. SCRIPTA is fully compatible with all APPLE computers.

For further information write, ring or call:

# BBC Microcomputer

◀ **TOMMY:** I was very impressed with the way the machine picked up the programs from the recorder. I have used cassettes on PETs (old ROMs, 1978 vintage!), Apples, and also pre-production versions of the ZX80, ZX81 and VIC, all with greater or lesser failure rate, but I was most pleased with the way the BBC micro just worked first time without any fussing with volume and tone controls. For any users who have Chris' problem with getting cables to match your recorder, I would advise you to have a chat with the dealer who sold you the computer. If you do go to a hi-fi dealer, take the reference manual with you, because that gives the connections for the cable.

The other programs on the tape are a fair assortment of novelty items, a 'sketch pad' program for doodlers, a calculator, a poem-writing program, biorhythms and so on. We will leave Chris playing with his new toy while I point out some of the features of the BBC micro which I think make it rather special.

The machine itself measures 16" by 13½" by 2½", so, while it is larger than a Sinclair or VIC, it is still quite comfortable on the lap. Not as cuddly as the *Printout* secretaries, but we can always wait for Mk II!

It has a more or less IBM standard keyboard, with all the options such as ESCAPE, CONTROL and also four cursor controls (no shift this or escape the other like Apples and PETs), and 10 soft keys, whose meaning can be altered by a program. If you are developing a program called "PROG", you might have one key saying LOAD "PROG", another saying SAVE "PROG", a third saying RUN and another LIST. In this way the four most common commands are replaced by a single key each. The keyboard action is a very good one, with full size keys; no Mickey Mouse stuff on this machine.

It is well provided with interfaces, having three different video outlets, a cassette port, an RS423 port (a super-RS232, fully compatible but going up to huge speeds) and an analogue input, which betrays its Atom ancestry, but also useful for Apple style paddles and joysticks, as well as a light pen. Slightly more exotic are a disk drive, a standard parallel printer port, a PET style user port, connections for Econet, Acorn's own network system (see the article on networks in January's issue) etc. etc. Not all of these are implemented yet, and some will only be available on Model B, the more expensive version.

The video display is very good, even on a standard television, with none of the colour fringing which spoils some systems. The resolution is also very good, going up to 640 by 256 dots on the Model B, while even the cooking version can manage 320 by 256. The system can be put into 'Teletext' mode, where each character is formed as for the Teletext standard, ready for connection to one of the Teletext systems. The normal character set is also user-definable, so you can create your own alphabets.

The BASIC language is not from Microsoft, but that is by no means a problem. Unlike Sinclair BASIC, it follows all the common BASIC standards, but with several very handy extensions not found in Microsoft BASICs in this price range, such as AUTO, RENUMBER, TRACE and DELETE.

In fact, the BASIC contains many features I have only seen on much more expensive machines. For example, you can define functions, using DEF FN, which are more than one line long, and include FOR loops, GOTOs and so on. You can also have procedures, which are like a cross between a function and a subroutine. It has a full error trapping system (ON ERROR GOTO). It has a formatted PRINT statement similar to the PRINT USING statement found in some BASICs, so you can format all your values to 2 decimal places padded to 10

characters, say.

Another very useful feature is that the BASIC interpreter has a built-in assembler, so it is really very easy to write mixed BASIC and assembler programs. The BASIC also contains many features to drive the various ports, so there are no nasty PEEKs and POKEs to be done before you use the serial port for example. In fact, the BASIC contains a lot of my personal favourites from a range of BASICs on many microcomputers. Now back to Chris.

**CHRIS:** *After trying several of the programs on the WELCOME cassette, I was very keen to have a go myself. As Tommy explained, we did not have the full range of teaching manuals, but the first 5 chapters in the user guide seemed to be a condensed version of the instruction books aimed at someone with no previous experience of computers.*

*I was soon able to show off my first program to an admiring wife, which asked her for the weight of a piece of beef, and told her how long it needed to cook. One problem did show up quite quickly, given my poor typing ability coupled with lack of programming ability. I remembered from my quick play with a VIC that I could change a program line by moving the cursor back and typing over the line. The BBC micro was a little more awkward. I think I will leave it to Tommy to explain.*

**TOMMY:** The editing on the BBC micro is not as bad as Chris is trying to make out. It takes a little bit more learning than the intuitive method used on the Commodore machine, but even he got the hang of it in the end. You can use the cursor control keys as in the PET, but now you have two cursors, and "editing" cursor, which is a flashing line, and the normal "input" cursor. When the editing cursor reaches the line you want to edit, you can press a "COPY" key, which copies a character from the line being editing to a new line at the bottom of the screen. The 'cursor right' key moves the editing cursor along without copying characters, and so it acts as a delete key. You can insert characters at any point by just keying them in; this is the insert function.

This is certainly a novel system; the nearest thing to it is the editing on Microsoft's MBASIC, which runs under CP/M. I would say it is better than the Apple editor, but the Commodore screen editor still rules the roost as far as I am concerned.

**CHRIS:** *Top sum up then, I was quite pleasantly surprised by my first real experience with a microcomputer. Even without the proper teaching manuals, and before I have seen the TV series, it was not very long before I was writing a couple of simple programs. Moreover, I now realise the huge gap between myself and trained programmers. Some of the advertising for home computers implies that if you buy such and such a computer, you will be writing stupendous games and business programs within a week. I am now more determined than ever to buy one of these beasts, but more worried than ever by the problem of the equipment being outdated within a week.*

**TOMMY:** I too was very favourably impressed by the BBC micro. On the grounds of appearance, the variety of ports, the power of the BASIC, and last but not least the speed. I managed to price Chris off the machine for long enough to do some simple benchmarks, and it is near enough twice the speed of my PET. Coming with 16K of RAM it gets my vote for best value for money in the price range.

To those of you who share Chris' worry about being outdated, I would say forget it! The fact that another machine has just been brought out with better performance does not make you machine suddenly useless; it will still perform as well as ever. If you are that worried about having the most up-to-date piece of kit, then I would say you are more interested in the ego trip than the computer and should stick to the established status symbols such as noisy bikes and flash suits.

# A Beginners Guide

"Don't plug Commodore" said the man from Commodore. "Write us an essay that people will find useful instead." It was an offer I couldn't refuse.

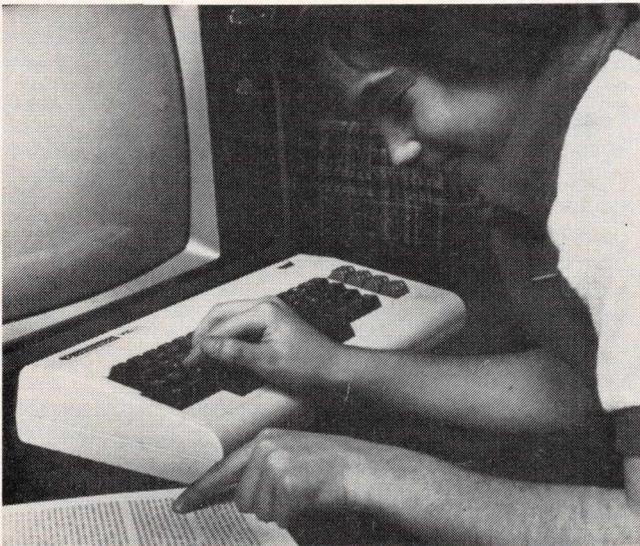

First things first then. Money. What do the darn things cost?

## At Home

Anywhere between £70 and £7000. Maybe more. What you need spend is, of course, another matter. To a large extent you get what you pay for. But for a real computer that you can use at home the VIC-20 at £189 including VAT has to be a strong candidate. Why?

Colour graphics (assuming you have a colour TV) and a proper typewriter keyboard for a start. And sound. And plug-in program cartridges.

Budget another £45 for a cassette recorder to store your own programs; typing them in from

scratch everytime is a real pain. It is likely you will want to add some additional memory to the 5K of Random Access Memory (equivalent to about 5000 characters of text) the VIC-20 arrives with. That's because only 3K is actually available for programming. Plugging in an extra 8K RAM cartridge will make a £45 hole in your pocket – but it will allow you to play Space Invaders!

Other popular and currently available home micros to consider are the ZX80 at £73, and the Atari 400 at £345.

## In the classroom

Schools have tended to opt for machines like the PET, the most popular choice, at £550 +

VAT for 16K version, or the more expensive Research Machines RS380Z. For this you get a built-in black and white screen, for giving upper and lower case letters plus graphics. As with all Commodore machines, the BASIC language – very easy to learn – is built in.

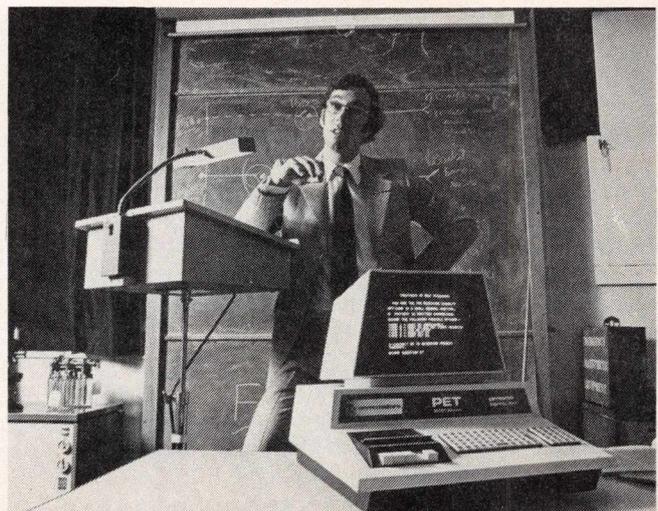

The other major plus is the software. Lots of it available from independent suppliers.

Commodore even give it away free if you are a school. Or you can swap with other teachers.

## In business

Advising businessmen on the right micro is tricky; so much depends on the quality of the programs. In fact some experts recommend looking for the program first. Fortunately for Commodore I can put hand on heart and say that no system offers a wider range of off-the-shelf business programs than the PET.

There are a few businessmen that get by with 16K of RAM memory and a cassette drive – but not many. A more sensible configuration would be 32K of memory and a floppy disk unit. Quite a few companies offer this specification including Apple and some of the new Japanese machines.

# to Micro Computers

by C.R. Oppenheim

To give you an example of pricing, the 32K PET with 337K bytes (characters) floppy disks costs £1390 + VAT. The Apple price would be similar but with much lower capacity disks. Add £395 ex VAT for a dot matrix printer and you have a pretty effective business system for around £1800.

A good sales/purchase ledger package will cost around the £300 mark on the most popular microcomputers, perhaps twice this price on the others. Economies of scale you see.

## Word Processing

Word Processing is probably the single most popular business application; it is so useful for sending personalised letters and maintaining lists.

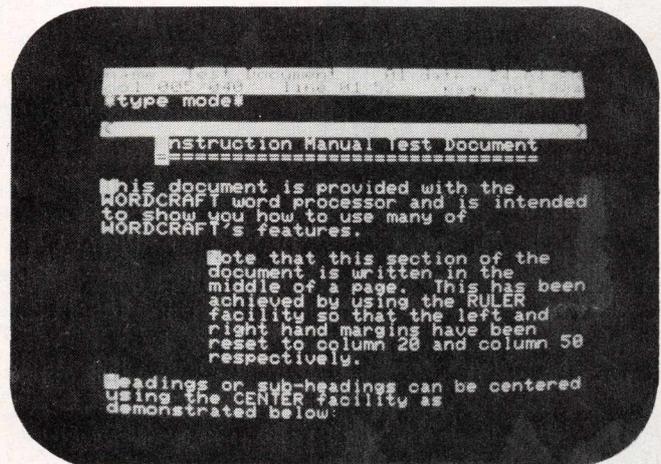

After looking at more expensive systems I chose a SuperPET; its larger screen giving me lines of up to eighty characters long. Keyboard layout is QWERTY like a typewriter, so my secretary's happy too.

After the American *WordStar*, which runs on CP/M based machines, *Wordcraft* is probably the best known word processing program, and at £375 + VAT it has the merit of being cheaper. After careful consideration that is what I chose.

Whilst dot matrix printers, which as the name suggests create the letters out of dots, are fine for accounts, a typewriter quality printer is better for word processing. Commodore's new daisywheel at £850 + VAT looks like a bit of a bargain; if you are feeling rich you could pay £2000 for another make which would get through your letters even quicker.

Adding up the cost of a Word Processing system based on the 32K SuperPET with the powerful 1 megabyte disks (they store 1 million characters approximately, the length of a Dickens novel!), the price comes in around £3000 + VAT. That's including the software!

That's about all I have space for, for now. But if you have any queries, drop me a line c/o Commodore. Or alternatively fill in the coupon for further details and the name of your nearest dealer.

Send to: Commodore Information Services,  
P.O. Box 109, Baker Street, High Wycombe.

# CP/M® for the PET .....

## Softbox

Simply by plugging the SMALL SYSTEMS SOFT BOX into the PET IEEE port and loading the CP/M disk, the PET will run under the world's most popular disk operating system, CP/M (tm). No internal connections or modifications to the PET are required.

Application packages designed to work with specific terminals (e.g. Lear Siegler ADM3A, Televideo 912 or Hazeltine 1500) will need no modifications to work with the PET screen, as the SMALL SYSTEMS SOFT BOX allows the PET screen to emulate any of these devices.

### Specifications

- Full 60k byte RAM
- CP/M version 2.2
- Z80 CPU running at 4MHz with no wait states
- Dimensions : 25cm x 9cm x 16cm
- Operates with any series 2000, 3000, 4000, or 8000 PET
- Supports up to 8 Commodore® disk drives in any mix of 3040, 4040, or 8050 drive types.
- Diskette containing CP/M system with utilities, and full documentation included in price. Please specify 3040, 4040 or 8050 disk format when ordering.
- Optional RS232 serial interface (with user definable baud rates) for use with a terminal or printer.
- Optional Corvus drive interface.

### SoftBox prices

SoftBox .....	£550
SoftBox with RS232 interface .....	£595
SoftBox with hard disk interface for Corvus drive .....	£615
SoftBox with RS232 and hard disk interface options .....	£660
SoftBox Manual .....	£5

### Hard Disks...

#### Corvus Drives

Well proven systems with the nationwide support and maintenance.

- 5, 10, 20MB capacity
- Up to 4 drives can be daisy chained
- Backup onto standard video cassette using the Mirror unit
- Up to 64 users with the Constellation multiplexer unit.

5MB Corvus drive.....	£2295
10MB.....	£3595
20MB.....	£4495
Mirror back up unit.....	£495
Constellation.....	£495

#### SSE Mini Winchester

Drive and Softbox housed in one small desktop unit. Single user.

3MB .....	£2420
6MB .....	£2620
12MB.....	£2920

## CP/M Software

### LANGUAGES

#### ALGOL-60 (Research Machines) £130/£20

ALGOL is a powerful block structured language featuring economical run-time dynamic allocation of memory. The compiler is very compact (24k) and supports almost all Algol 60 report features.

#### C COMPILER (BD Software) £80/£15

This compiler supports most major features of the language including structures, arrays, pointers and recursive function evaluation. The compiler produces compact, relocatable 8080 code for use with the linker and library supplied.

#### CBASIC Compiler Systems £75/£12

This is a non-interactive BASIC used by many business application programs. It supports full file control chaining formatted output and random disk file access, 14-digit arithmetic WHILE/-WEND and optional line numbering.

#### C COMPILER (Whitesmith's) £325/£20

This compiler conforms to the full UNIX version 7 implementation of the C language, which has more facilities than Pascal or BASIC and produces faster code.

#### S-BASIC £155/£20

A structured BASIC compiler generating 8080 native code, combining structured programming and the speed of machine code while maintaining the convenience of BASIC.

#### BASIC-80 (Microsoft) £175/NA

This is Microsoft Extended BASIC interpreter, version 5. It is a powerful, ANSI compatible disk BASIC with many features not found in PET BASIC, such as WHILE/WEND, chaining, variable length file records, double precision floating point, PRINT USING facility, error trapping, hexadecimal numbers and more.

#### BASIC COMPILER (Microsoft) £195/NA

This compiler is language compatible with the Microsoft version 5 interpreter but generates 8080/Z80 machine code, so that program execution is typically 3 to 10 times faster.

#### COBOL-80 (Microsoft) £375/£20

An ANSI '74 COBOL compiler producing relocatable modules compatible with FORTRAN-80 or MACRO-80 output. COBOL-80 has a complete ISAM facility and interactive screen handling.

#### CIS-COBOL (Microfocus) £425/£30

An ANSI '74 standard COBOL compiler fully validated by U.S. Navy tests to ANSI level 1. The compiler also supports many features of level 2 including dynamic loading of COBOL modules and a full indexed Sequential (ISAM) file.

#### FORTRAN-80 (Microsoft) £230/£20

The popular science and engineering language, complying with the ANSI '66 standard (except for the COMPLEX data type), with enhancements such as mixed mode arithmetic.

#### PASCAL/MT+ £265/£20

A Pascal compiler meeting the ISO standard, with many enhancements including full string handling capability and random access files.

#### PASCAL/M £220/£15

This compiler produces p-code and is an extended implementation of standard Pascal, with long (32-bit) integers, a SEGMENT procedure type (for overlays) and an added string data type.

#### PASCAL/MT £160/£20

This is a subset of standard Pascal, which generates ROMable 8080 machine code and supports interrupt procedures, CP/M file input/output, and assembly language subroutines.

#### PASCAL/Z (Ithaca Intersystems) £205/15

A compiler producing ROMable, re-entrants Z80 micro-code highly optimized for speed, supporting variant records, strings, CP/M file input/output, and assembly language subroutines.

#### muLISP £110/£15

LISP is an interactive programming language widely used for artificial intelligence applications.

#### PL/I-80 (Digital Research) £265/NA

A general purpose application programming language giving mainframe capability for developing large-scale structured programs in a microcomputer environment

#### TINY C TWO £130/£30

A compiler written in TINY C. The source code is included on disk.

### WORD PROCESSING

#### WORDSTAR (MicroPro) £255/£35

A powerful screen-oriented word processor designed for non-technical personnel. Text formatting is performed on the screen, so that what you see is what your print-out will look like. WORDSTAR'S advanced facilities include justification, pagination, underscores, boldface, subscript and superscript, block movement of text.

#### WORDINDEX (MIDAS) £100/NA

A program to assist WORDSTAR users by generating a table of contents and index from a WORDSTAR document.

#### MAILMERGE(MicroPro) £80/£15

MAILMERGE is an add-on utility of WORDSTAR users allowing the production of personalized form letters or other documents from a mailing list made using DATASAR or NAD. Requires WORDSTAR.

#### MICROSPELL £130/NA

This is a spelling help program which scans through a document file stopping at each dubious word, offering correctly spelt alternatives and allowing you to correct the word with a keystroke

### TELECOMMUNICATIONS

#### BSTAM £105/NA

This telecommunications utility permits any type of CP/M file to be transferred to or from another computer also equipped with BSTAM. Transmission occurs at full speed with CRC error checking and automatic error recovery.

#### BSTMS £115/NA

An intelligent terminal program permitting communication with a mainframe computer.

### NUMERIC PROBLEM SOLVING TOOLS

#### T/MAKER II £185/£15

An advanced utility for preparing management reports with tabular data, combining visual calculator with a full screen editor.

#### MICRO MODELLER £425/NA

The number one Financial Modelling and forecasting program.

#### ANALYST (Structured Systems Group) £130/12

A customised data entry and reporting system in which the user specifies up to 75 data items per record, and can use interactive data entry, retrieval and update facilities to make information management easy.

#### muSIMP/muMATH £135/£20

A package of programs including muSIMP, a high level programming language for symbolic and semi-numeric processing, and muMATH, an interactive symbolic mathematics system written in muSIMP.

#### STATPAK £260/£20

A professional statistics and probability package which can rapidly handle large files of data.

### DATA MANAGEMENT SYSTEMS

#### dBASE II £385.00

An interactive relational database management package with full screen formatting and its own fully structured high level command language. Interactive data entry and Validation with WordStar-like commands. Allows you to develop application packages in days rather than months.

#### MDBS £475/£30

Micro Data Base System is a full network data base with all the features of HDBS, with fixed or variable record length, read/write protection at the ITEM, RECORD, SET and FILE levels

### ACCOUNTING PACKAGES (GRAFFCOM)

PAYROLL	£475/£35
COMPANY SALES	£425/£35
COMPANY PURCHASES	£425/£35
GENERAL ACCOUNTING	£375/£35
STOCK CONTROL	£325/£35
ORDER ENTRY AND INVOICING	£325/£35
ADD	£255/£35
TIME RECORDING SYSTEM	£375/£35
LEASE RENTAL AND HP SYSTEM	£375/£35

### LANGUAGE APPLICATION TOOLS

#### FORMS 2 for Cis Cobol £110/NA

#### FABS £105/£15

FABS gives you rapid access to large data files by using balanced tree structures containing up to 65,000 records. Instructions are included for use with CBASIC2, S-BASIC, BASIC-80, BASIC compiler, PL/I-80, Pascal/MT + and FORTRAN-80.

#### M/SORT FOR COBOL-80 £130/£12

A record sorting utility for COBOL-80 conforming fully to the ANSI '74 level 2 sort/merge standard (except for alphabet name collating sequence).

### SYSTEM TOOLS

#### CROSS ASSEMBLER £95/£10

XASM 05, 09, 18, 04, 65, F8, 65, COPS 400 and 51  
Cross assemblers for the Motorola 6505, Motorola 6809, RCA 1802, Intel 8048, Motorola 6800, Fairchild F8, MOS Technology 6502, National Semiconductor 400 and Intel 8051 families.

#### NEW...

#### BASIC 48 - Enhanced Basic Compiler £195/£10

Produces highly optimized assembly source for 8048 family. Includes XASM48

small systems engineering limited

# MICRO-GEN

## JOYSTICKS FOR THE ZX81

as seen at the ZX Microfair

- \* The most exciting development ever for the ZX81.
- \* Turns your ZX81 into a true programmable games machine.
- \* Free yourself of that dead unresponsive keyboard.
- \* Play interactive games with immediate response.
- \* Controller board fits in between the RAM pack and the ZX81. (No skill is required to make this connection and it actually improves the stability of the RAM pack.)
- \* Up to 2 joysticks may be attached to the controller board thereby allowing 2 players to play games against one another.
- \* This add-on extends the capability of the machine: imagine the tremendous variety of games that now becomes possible.
- \* Details supplied on how to use the joysticks in your own programs.

For the games presently available you will require a Controller Board price £19.50 and one Joystick price £9.60 (Please add 0.80p P&P).

Games available: (many more to follow, especially 2 player games)

ZX Space Invaders + ZX Maze £6.95 plus 40p P&P

ZX Breakout £4.50 plus 40p P&P

Other MicroGen games (not using joysticks):

### ZX81 CHESS

- Look at these features
- Graphic display of positions on chess board.
  - Displays separate record of your move and the computer's.
  - Written in Superfast Machine Code.
  - Plays all legal moves including Castling and Enpassant but if an illegal move is entered will answer illegal move.
  - Six levels of play.
  - Random weighting computer doesn't always play the same move in an identical situation.
  - Board can be set up to any configuration and you can even alter or exchange sides in mid game.
  - Amazing power is 10k of memory.
- PLUS Chess Clock!
- Records and displays time taken per player.
  - Resettable function.
  - Single key entry.

Only £9.50 plus 49p P&P

**Warning:** This game has proved to be so addictive MicroGen accepts no responsibility for insanity, divorce proceedings, or any other damage thereby incurred.

Fast addictive game

### ZX NEW YORK

- Can you bomb and shoot your way out of trouble before your plane crashes into the buildings.
- Written in Machine Code Different pattern each time you play.
- Score continuously incremented, at end of game.
- Nine levels of play.
- Simulated bombs and rockets that is destroyed by building PLUS ZX Reflex
- Are you as fast as you thought find out with this game.

Only £4.50 plus 40p P&P

*If you write a program which is exceptional, submit it to us and if suitable, we will offer a royalty.*

Cheques and P.O.s payable to MicroGen, Dept. MP,  
24 Agar Crescent, Bracknell, Berks. Tel. (0344) 27317

# READ/WRITE

## Mixing business & pleasure

I wonder if you can help me.

I am a self-employed, really a one man band, life assurance and financial investment consultant. I sought a lot of advice from various firms marketing microcomputers in the Midlands to find a set up which would fulfill my needs. After a lot of conflicting and very disturbing advice I purchased the following equipment:- Commodore 8032, 8050, 8027 printer, and software, VisiCalc and Wordcraft 80.

The equipment and software seem ideal – the Wordcraft for word processing and VisiCalc for my investment monitoring and calculations.

Would you please advise me on the two following problems?

1. Is there a software package which will store all my client's records, that will enable me to call on client's records within certain categories, for example, by age, or occupation, or family size, or type of policy? Also is it possible for these clients records to be stored in alphabetical order, rather than in random order, even though they may be inserted not in alphabetical order?

2. With the limited number of investment clients I have, at the moment, there is enough memory in the VisiCalc. I expect in the not too distant future, that I will reach the limit of the 10K for any one group of investors. Is there any practical way of using more of this very clever and useful tool, to overcome the limitation that 10K for one page imposes?

I hope the above is clear and that you can assist me in using my equipment more fully. By the way, on a lighter note, can you advise me of some games software suitable for the 8032?

F.W. Halliday,  
Sutton Coldfield

*Your story about conflicting and disturbing advice from rival micro suppliers rings very true, Mr Halliday, and we would always recommend to the first-time buyer that he obtains sales references from any supplier before making a commitment.*

*What you need for your clients' records is quite clearly a database – and for a full explanation of the state-of-the-art and allied jargon, see the feature this issue – and the Software Buyers Crib Sheet (November 1981).*

There are many such packages suitable for the 8032/8050 including DMS, PETAID, OZZ and others. The former two will actually link into Wordcraft allowing you to make use of clients' records when preparing standard letters or reports. Alphabetic sorting is common to most databases – though you should check carefully.

The request for more VisiCalc memory is a common one – and unfortunately the PET is not an easy machine to expand. Commodore have released a 64K add-on board for around £250 which would increase your memory to 96K. A new version of VisiCalc is available from ACT

Microsoft – and several other major software suppliers will follow suit.

Whether to make available games for the 8000 series PET has been one of Commodore's most prolonged dilemmas – since they are worried about degrading the businesslike image. Audiogenic Ltd. of Reading, however, have now made available a good range of 8000 games – by means of an ingenious routine, which makes the 8032 look like a 40 column machine to the program.

## Galactic declaration

Having recently seen your November issue of *MicroComputer Printout*, where you asked for Nascom users to come forth, we decided to do so.

Our small society uses two Nascom 1's (we noted that your illustration in the November issue showed a Nascom 2), one of 64K and the other of 32K. These

computers are used to run the Scottish Regions version of Galactic Society Four, a Science Fiction war games society.

Programs are run in both BASIC and Z80 machine code, and sometimes both simultaneously. Without these machines we could not run the wargame on anything approaching the scale we do. All the leg work of processing financial files is eliminated and the bulk storage of information is made easy.

At the moment, we have only two Nascoms at the central site, but are working on designing modems for a network of Nascom 1 machines throughout Scotland. Just to show that we are not biased towards Nascom machines, we also use Acorn micros for our Research department and hope to be adding the new BBC machine in a few months.

The original owners of Nascom suffered a great deal of abuse for their handling of the product, mostly because they did not appreciate just how many Nascoms they would sell in their first year. The new owners (Lucas Logic) are making slow but steady progress in opening up the market for new Nascom products, like their 64K memory board, retailing at £140 plus VAT. Which means you can get a 64K machine (with BASIC on tape) all for under £500 (plus VAT). That is why we use Nascom 1's and we would be happy to hear of anyone else interested in setting up a national network of Nascoms.

G.J. McPhee,  
Galactic Society Four,  
5a Hamilton Court,  
Calside, Paisley, Scotland.

## BBC Points of View

Read/Write January 1981 Brickbats and Bouquets.

I endorse the pro ZX81 anti ZX81 software sentiments expressed by J.R. Byng and I accept your timely reminder that one cannot really expect much software advice at the price. The point remains why does Sinclair sell the £3.95 cassettes under its own label and still disclaim any association with the writers?

Now that the BBC Computer Literacy Project is under way, I am looking forward to a *MicroComputer Printout* assessment of this programme.

A. Wolstencroft,  
Knutsford, Cheshire

*We take the point about branded software, Mr Wolstencroft, and as for the review of the BBC series, our resident genius, Tommy, will be viewing them with a critical eye, alongside newcomer, Chris Heaton.*

## U.F.O.

Did the illustration accompanying 'In Touch with Aliens?' (*February issue*) really show a man undergoing the electric chair as Inside

Trader stated? Or was it a sick joke? And what had the article got to do with computers anyway? Do you people know what you are doing?

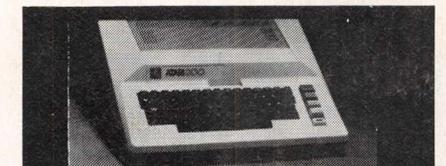

Doug Bough,  
Warminster, Wilts

No. YES. Not a lot. No.

## Atari Rainbow

Congratulations to Terry Hope for a well-researched article on Colour Graphics in the January issue.

Regarding the statement suggesting that

only five colours can be displayed at any one time, however, your readers might like to try the following:-

```
10 GRAPHICS 11
20 FOR X=1 TO 190:COLOR X/12:PLOT
1,X:DRAWTO 79,X:NEXT X
30 GOTO 30
```

The above program will display 16 colours on the screen and is in fact similar to Graphics Mode 9 except that instead of one colour and sixteen luminescences this mode allows only one luminescence and sixteen colours.

A. Jones,  
Ingersoll Electronics  
London

# READ/WRITE

The Editor welcomes your letters, but if you require a personal reply please enclose an S.A.E.

## Brass knobs for Atari

As an Atari 400 owner I was most interested in your article on colour graphics in the January issue. My thirst for information on Atari has led me through your pages in previous issues to no avail. I shall be sure in future, however, to keep in close touch with *MicroComputer Printout*.

What about some more information on those extra graphics modes. I ran your "Brass" program and was most impressed.

I. Skinner,  
Mile End, Stockport

Since publishing 'Colour Graphics', my poor predecessor, Terry Hope, has had to go into hiding to avoid the barrage of letters and phone calls from Atari owners demanding to know more about the previously undisclosed graphics modes.

Terry has promised, however, to divulge all in a second article if bribed with sufficient Scotch. Donations please to:- Editorial Lubrication Fund, c/o Microcomputer Printout.

## ? Computational Error

Concerning "Instant Software: Business Programming Made Easy" by Mike Gross-Niklaus, Jan 1982 issue of *MicroComputer Printout*.

On page 68 Mr Gross-Niklaus states that to convert square feet to square yards one multiplies by 9. Surely not – unless there are now three yards to one foot.

Anybody following Mr Gross-Niklaus'

instructions would end up buying 81 times as much carpet as they needed because, as I am sure he knows, to convert square feet to square yards one must *divide* by 9.

M.W. Peters,  
Liverpool L8

## System crash

'Great Computing Disasters' (*February issue*) omitted almost all of the really great

debacles of the past five years. To wit, the CompuThink disk, Apple III, The Byte Shop crash, Kit Spencer, PCW's "Last One" review, the New Brain, ACT's piracy case, Computer Age magazine and the VIC power supply (with 'melt down' facility).

Nick White,  
Slough, Berks

*You missed out the Gregory Yob manual.*

## Love at first byte

In response to "Not for Publication" (Read/Write Jan '82) – which I must point out, you *did* inadvertently publish:

As company secretary of Close Encounters Singles Group, a *personal* introductions agency, abhorring this use of computers, I would like to ask Mr. A Glotz why he feels the need to use his Sinclair ZX81 at all. His principles are as excellent as are (presumably) his male members – but to attract the ladies he must use the personal touch.

May I also suggest that "Computeraunch Intros" could have just the teensiest M.C.P. ring to it?

Close Encounters is the largest Personal Introduction and Social Group in the United Kingdom. I would like to offer my experienced advice to Mr. Glotz, or to anyone else who may be interested, if, in return, he could offer suggestions on the alternative uses of my own underworked, and rather bored Sinclair ZX81.

Julia Hamilton-Keeling  
Close Encounters,  
Blundellsands, Liverpool

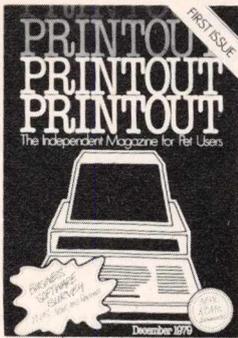

*We are passing Ms. Hamilton-Keelings home telephone number to the gentleman who placed the following small ad in our classified column: 'Sincere tall editor, mid-twenties, own Porsche, seeks intro to blonde, well-built female person for friendship etc. Box 69'*

## Magnetic disaster

In view of your article on Great Computer Disasters, you may be interested in the following story:

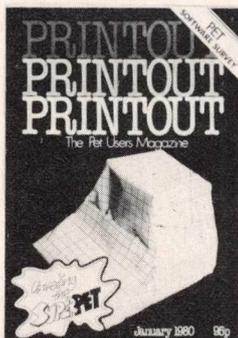

Recently an American working in Britain tried to use for the first time his cash dispenser card, when he needed money outside of bank opening hours. He knew he had followed the instructions correctly and he knew he had money in his account, but the machine kept rejecting his card. His bank manager could see no reason why this should happen and gave him a new card. The same thing happened with the second card. By the third card this gentleman was becoming both annoyed and mystified. Then he saw that in his wallet where he kept the card a paperclip was clinging to another card which electronically operated the doors to his office. There was also another card in his wallet which was magnetic. These cards had reversed the polarity of the bank cards, so making it impossible to use them. The bank has now had to issue a warning to people to make sure they keep their cash dispenser cards away from anything magnetic.

Mrs S. Taylor,  
Hove, Sussex

## One born every minute

You would think that by now the Press would have twigged that with Commodore, nothing is *quite* as it seems.

Take recent reports in the *Wall Street Journal*, bible of the American financial community, and our own *Guardian*. According to these, Commodore have invented a computer which can emulate any other computer.

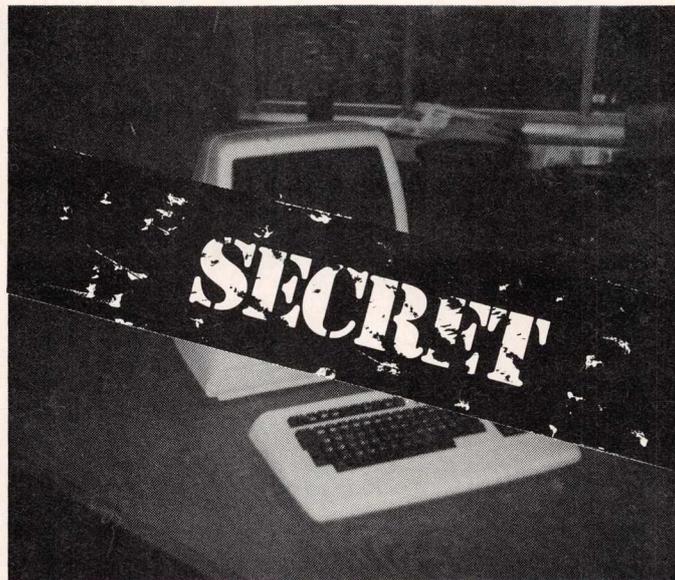

The truth is as usual somewhat different – and a lot more interesting.

Commodore have developed a new line of computers, as predicted in this column. The first of these is the anticipated 40 column SuperVIC with a PET-compatible 40 columns x 25 line screen display, and 16K of RAM. However, with the VIC-20 doing well, it is unlikely to be seen here before the Autumn at the earliest. No surprises there.

Commdore's Chairman, Irving Gould, also announced an inexpensive game computer intended to compete with Sinclair. Dubbed the Ultimix it boasts a flat membrane keyboard, and plug-in cartridges which convert it from games machine into music synthesiser. Plug a BASIC cartridge in and it becomes a computer. These cartridges are said to be VIC compatible. The American retail price quoted by Mr. Gould is \$149.95, with deliveries to start "in the Spring".

Personally, I wouldn't count on seeing any Ultimaxes on sale here before Autumn at the earliest.

Uncle Irving also announced something called the Commodore 64. And this is where it gets interesting. According to the press release put out by Commodore following his statement, this is "a full colour 40 column micro with 64K of built-in memory retailing

at \$595 – making it the world's lowest-priced microcomputer with a built-in memory of 64K."

With Commodore, it is sometimes necessary to read between the lines. Compare then Commodore UK's press release with that put out by the American parent, and several interesting things emerge. First, the British lot have taken care to put everything Mr Gould said in inverted commas – almost as if they disassociate themselves from their chairman's remarks. Secondly, they don't add any additional information – like prices or release dates.

So what are we to make of all this? Here's my analysis.

The Commodore 64 is a replacement for the 40-column PET. But don't expect any funeral announcement – just a cessation of supplies – probably late Autumn, when they have had a

chance to sort out the problems of converting the 64 to our PAL TV system.

Secondly, the 64 is just the first of a new range, and will rapidly be joined by Commodore's real entries for the great business computer race: a CBM128 and a CBM256 with 128K and 256K of RAM respectively. Photographs in my possession show an 80 column version with integral disk drives .....

An 8088 softcard is under development, but not yet operational. When ready, it will enable the new machines to run programs written for the IBM and Sirius computers, and indeed any software running under the CPM/86 or MSDOS operating system.

Useful though that will be, it is not the same as compatibility with "any other" computer. But then, with Commodore 'wait and see' it is often the wisest policy.

## Rigor Mortis

I rather hesitate to mention newsletters again. No sooner was the ink dry on my last two recommendations than both went into terminal interrupt mode.

There being no shortage of punters ready to lose their entire wardrobes in publishing, allow me to introduce Michael Flusky and *Software Brief-In*. Issue Number One of this eight pager deals with such topics as the current legal status of software copyright. There are also reviews of three word processing packages and a roundup of software news. Subscriptions cost £3.50 for 10 issues, from 7 Banstead Road, Purley, Surrey.

Michael Commendal, ex-editor of an American micro magazine has also invested his life savings in a newsletter. This one is called *Programmer*, has 12 pages and costs \$13 for 6 issues from P.O. Box 3210, Manchester, N.H. 03105, USA. It seems to be aimed at those who make their living from program royalties, an occupation that must enjoy about the same degree of financial security as newsletter publishing.

## Cheapest Daisywheel

Daisywheel printers – they are the ones that produce typewriter quality printing – have always been expensive. A press release announcing a Triumph Adler daisywheel for £695, arrived on my desk with a scribbled note from the Editor asking "Is this true?"

Yes, say the distributors, Butel-Comco of Garrick Industrial Estate, Hendon, London. Which must make it the cheapest on the market. Unless, of course, you know different.....

## Chess playing Monkeys

The computer's reputation as the dumpkopf of the chess world took rather a dent last month when a new British designed machine made monkeys out of a number of the worlds top players.

Monkey Number One is the leading Soviet chess problem expert, L. Zagornjko, who won first prize in an important competition by composing a famous problem to which none of the judges could offer a solution other than Zagornjko's own. The rules require that a winning problem admits of only one solution.

To the embarrassment of all concerned the *Chess Champion*

Mark V has now come up with two more solutions to the Zagornjko problem during the course of man-vs-machine contest with Monkey Number Two, International Master, Dr. John

Nunn. That's him on the right with a red face.

SciSys who market the Chess Champion (£279 inc. VAT) aren't saying who programmed it, but I rather suspect that David Levy

(pictured left) knows something about it. He is the International Master who, in 1969, took – and won – a bet that no computer could beat him in the next ten years.

SciSys haven't been overly forthcoming about the machine itself either. The Chess Champion V's success – it *is* the current champion in the 'commercially available' class – may however also owe something to the 48K bytes it has to run in. An unusual feature is its ability to retain moves made in the game being played after it has been disconnected from the mains.

I need hardly add that it made a monkey out of me in no time flat.

# Beware of the 'Fuzz'

Peter Laurie is man with a problem. He, Prof. Frank Knowles, and Anthony Macilwaine have come up with a revolutionary software product. But being Editor of a journal that styles itself 'Britain's leading microcomputer magazine' (all right: it's Practical Computing - although we don't concede the description) he can't very well be seen pushing his own products. I practically had to beg him to send me details.

The product in question is *Superfile*, and as I said it is revolutionary. Why? Fuzzy matching principally.

Perhaps I had better start at the beginning. *Superfile* is a database management system for micros. Nothing new in that? You'd be wrong, because the one thing the database management experts of my acquaintance agree upon is that none of the current crop of micro databases are worthy of the name.

*Superfile* is a very different cup of tea. It is extremely simple, very fast, and quite big: a hard disk system running under CPM 2.2 can handle 15,000 documents, each containing 100 words or figures. You don't, of course, need a hard disk if your requirements are more modest.

It is also pretty efficient, there being no restriction on the size or type of information fields. If a surname is just three letters short, *Superfile* will accept it without wasting space.

The structure of the records seems to be completely flexible, so if you want to add new useful information even if the need to was unforeseen when the database was set up, you can.

Best of all, there's fuzzy matching. That means that if a Dr. Osborne rings up and you want to find his record, the fuzzy matching mode allows a search for Osborn, Osbourne, even Ozbourn. It will bring back the details of anyone who *sounds* like the name you asked for.

*Superfile* costs £175 from Laurie at Southdata Ltd., 10 Barley Mow Passage, London W.4. They also do a CPM Spelling Corrector program for £95, which unlike others on the market, spells in *English* rather than American.

# Trouble at t'Beeb

It is true. There really is no business like show business, and with the BBC Computer Literacy Project now well under way, it is interesting to watch the speed with which the organism grows. The number of associated companies and individuals

ago with the suggestion that the BBC might actively assist in the aim of increasing public computer literacy. Plans were drawn up for a series of programmes that would teach BASIC computer programming.

The problem of course was

Ian McNaught-Davis and Chris Serle presenting THE COMPUTER PROGRAMME

involved increases daily.

There's BBC Enterprises who market the BBC machine, BBC Publications who sell the book, the National Extension College who run the 30-hour BASIC course, and, of course, Acorn, who designed the computer. Not to mention Telesoftware project managers and local support networks too numerous to mention.

So impressive is the machine (see our feature, this issue) and the organisational machinery surrounding it that it's all too easy to get caught up in the tide of euphoria that has already engulfed the above named participants.

What's rather more interesting is how this situation arose. It seems to have started two years

which BASIC? The BBC's conclusion was that the best policy was to opt for one that was (1) fairly standard and (2) powerful enough to cope with high-level colour and sound commands. And since there wasn't a British machine around that fitted the bill, the Beeb decided to specify a design of their own.

There then followed several months of design work, tendering and heated arguments with rival manufacturers. After a false start, the final choice was for a system based on a machine which Acorn Microcomputers had "nearly ready" for market. It is that, with only minor modifications, which is now being sold as the BBC Model A and B computers.

And very sophisticated

machines they are, too - as you will read in Tommy's evaluation later in this issue.

In the intervening two years the concept of the T.V. programmes changed dramatically as the first showings revealed.

The aim of the series is no longer to teach BASIC. Indeed, if it is BASIC you are after, you will need the '30 hour BASIC' book and correspondence course offered by the National Extension College. Instead the TV series sets out to provide a general introduction to the world of computers.

True, potential applications of computers are illustrated with the aid of a BBC machine - but with the BASIC tutorial now axed - one can't help wondering if the computer is really justified as a BBC product. It is certainly true that they have created an excellent machine, but by all accounts, Acorn would have brought it to market on their own.

So with the pot of gold now firmly in the hands of BBC Enterprises rather than T.V. Centre, the rumblings have started.

The BBC, so beloved by the British populace for its integrity and independence, is governed by a charter, which covers amongst other things, the marketing of associated products: The Book of the Film, The Record of the Theme Music, and so on. That charter expressly prohibits the making of programmes that promote peripheral products.

From what I hear, this particular affray may rumble on for some time to come.

# It can send you blind

Computer games are bad for you. What's more, they are undermining our heritage, according to the Council for the Preservation of Rural England who object to the Space Invasion of rustic pubs.

The Association of Technical and Managerial Staffs reckon that being very close to a computer screen constitutes a health risk. And the Noise Abatement Society's views on the subject have no place in a family magazine.

To make matters worse Thorn/EMI, that pillar of the electronic establishment have gone and converted the few remaining traditional pastimes - Cribbage, Dominoes, Snooker, Billiards, and, yes, Darts - into programs for the Atari computers, with VIC versions to follow.

At £20 each (that's cassette not cartridge) they aren't cheap, but

Atari 400 - now enhanced by more high-quality games

the quality of sound, graphics and game interaction is superb.

Tommy, who boasts his own billiards table, is a trifle sceptical of the rules as implemented in their snooker game. But then no

one in their right mind would take on Tommy, who in defeat has been known to clear a crowded bar with his cue.

The jigsaw program's quite good too. And safer.

# Who shot TI?

So far, in the great microcomputer race, the Texas Instruments TI99/4A Home Computer has been firmly placed in the Also Ran category. Yet in our recent comparative survey of microcomputers (*Which Home Computer?* February 1982) – which, incidentally, has already caused more than a few raised eyebrows – the TI scored consistently high in all categories. So why hasn't it been a roaring success?

First, a history lesson. The TI 99/4 was introduced into this country around 18 months ago as a microcomputer designed specifically for the home. It was supported even from the earliest days by a range of high-quality plug-in program cartridges. And for once, the manufacturers didn't pretend that their machine was equally suitable for business.

But there was a snag. According to one school of thought the Texas giant ran into technical difficulties. The alternative version is that it decided that the European market simply didn't justify the development costs of producing a customised machine.

Either way, incompatible T.V. standards were the root of the problem. While American T.V. sets work on a colour system called NTSC (often described as Never The Same Colour), most European systems are PAL (naturally the French are different). The result was that a low-cost microcomputer had to be sold with a not-so-low-cost American standard monitor. Total bill £1,000. Total sales? Texas prefer to draw a veil over the subject.

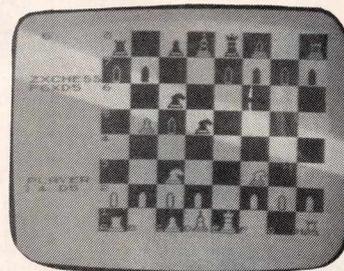

In September of last year, TI's computers informed them that they were in an ongoing marginal overseas sales situation, and a PAL version was finally released, only to be rendered obsolete almost immediately by the improved 99/4A.

The improvements included a proper typewriter keyboard, upper and lower case text on screen – and sound that came out of the T.V. speaker. The 99/4A now costs £299.95 and plugs directly into your own T.V. A wide variety of peripherals are available, including a 200 word speech synthesiser (very good speech quality). Solid-state software ranges from Household Money Management to Electrical Engineering, with many a game in between.

According to Nick Hills of TI, the company is still battling against public opinion. "Our

The TI 99/4A with typewriter keyboard and improved design.

**ZX CHESS.** I know. I didn't believe it either. But here are the pictures to prove it. The pieces are normally represented by letters, K for King, R for Rook and so on. But if you add the Quicksilva graphics board you can have pretty graphics too.

Author Richard Turner tells me that **ZX Chess II** has a rating of 110 on level 3 at his local club. It costs £15 from Artic Computing, 396 Reckitt Avenue, Hull, North Humberside.

initial growth was stunted by the need for the US monitor," he says, "and the TI machine is still remembered for that."

But with the 99/4A currently being test marketed by Boots, Rumbelows, Argos, Comet and Kays, that situation looks set to change.

## ZX Joy

The most vehement criticism I hear is invariably directed at the Sinclair ZX81's keyboard, a flat touch-sensitive sheet of mylar on which the keys are printed. Which is curious since few of the complainants are more than two-fingered typists.

Mind you, a lot of ZX81 owners are playing games these days and it is frustrating (not to mention dangerous) to be scrabbling around for the 'Fire' button when the alien ship moves into view.

Now Sinclair owners need suffer intergalactic zap no longer. MicroGen have come up with a joystick that connects between the ZX81 and the 16K expansion RAM pack. To use it, a short PEEK routine is added to BASIC programs.

£30 buys you the controller board plus one joystick. A second one can be added upon payment of £9.95. At present the board lacks any casing, but MicroGen plan to offer one in due course.

They will also be marketing Space Invader and Breakout games which use the joystick.

Details from 24 Agar Crescent, Bracknell, Berks. Tel. 0344 27317.

**How big is big?** ITT must qualify whichever way you define the term. So the trade held its breath last month when the electronics giant whipped the veils away from its new mystery micro.

Having previously marketed a badge engineered Apple II as the ITT 2020, until a little misunderstanding with Apple put paid to the arrangement, ITT were expected to reveal something rather special.

Instead the eager hacks found themselves confronting what one distinguished reviewer described as "the identikit 1981 machine". He was referring to the well tried combination of Z80A central processor, 64K bytes of RAM, 80 characters x 24 lines screen format and twin 280K disk drives, running under the CP/M operating system. Word processing and database packages are also thrown in for the £2,500 it will retail at when it goes on sale next month.

"A year ago I would have been over the moon" one dealer commented, "but today it all looks a bit old hat."

But I wonder. ITT is after all a company with a certain amount of financial muscle, and these days it is marketing and money that count at least as much as state-of-the-art technology.

Further enquiry suggests that the trade would be making a mistake to write the ITT 3030 off too soon. It is clearly a workmanlike machine and the design is modular. That means the Z-80A could be swapped for the bit Intel 8086 CPU and associated firmware. Other optional upgrades promised include 512 x 512 dot high resolution graphics, double density disk drives offering 1120K bytes of online storage, and an interface card for one or two 5 1/4" Seagate/Honeywell hard disk drives, providing either 5 or 10 megabytes capacity.

To my mind a bigger question mark hangs over ITT's distribution. Dealers who signed up for the ITT 2020 (the Apple look-alike) have deserted in droves to Apple. ITT are dismissive. "We are not interested in people who sell computers to enthusiasts; the new 3030 is a business system and will be sold by business dealers" say the Consumer Products Division.

Prospective business dealers may find, however, that ITT are actually in competition with them. The Business Systems Group having earmarked "big users" as its territory.

Which brings me back to the question with which I started: How big is big?

by Julian Allason

# Into Orbit

The prepackaged software industry seems to be suffering a growing credibility problem.

Last month over a hundred press releases landed on my bed (traditional working place of the hard working hack), each of them announcing the launch of a radically new, vastly superior business software package.

What they also have in common is a slavish adherence to the time-worn principles and procedures of data processing, i.e. mini computers and upwards.

Worse – they all suffer from what Americans term the Not Invented Here syndrome. Rather than make use of someone else's well-thought-out screen format or command syntax, they invariably feel the need to redesign the concept from scratch – thereby eliminating any possibility of establishing standards.

But my attention was caught recently by word of a new package called *Orbit*, not least because the authors, Vlasak, had relinquished their business of selling Apples, to market the package full time.

*Orbit* is a suite of commercial programs comprising Stock Control, Sales and Purchase Ledgers, Invoicing, and General Ledger, which can be integrated together. That is to say, the raising of an invoice also updates the stock level for the appropriate lines, and makes the necessary entries in the Sales and General Ledgers. It runs on any Apple kit.

Nothing new so far – except perhaps the word *any*, since it covers both Apple II and the new Apple III, *any* printer you care to mention, and *any* configuration of disks. That includes the small 5"

disks, twin 8" jobs yielding 2.4 megabytes, even one or more of the new Profile Hard Disk units for Apple III. Vlasak have genuinely attempted to cater for all possible future expansion and,

*Orbit* runs on both the long-toothed Apple II and new Apple III with Profile Hard Disk (right).

should you choose to upgrade your hardware at a later date, it is not necessary to re-enter existing information.

Furthermore, *Orbit* is designed to make use of multi-user configurations as and when they become available for Apple disks, with the requisite security controls already built-in. This approach should help to allay the fears of the buyer, worried about his software becoming obsolete.

The package itself is configurable, which is to say that when each package is installed, it is configured to the customer's requirements and hardware according to the answers given to a series of questions. These include accounting periods used, name of the company to be shown on each statement, and so forth.

In operation, each program shows a high degree of user-

friendliness with all inputs properly validated and protected against illegal responses, and with on-screen references pointing to the page in the instruction manual should you get stuck.

permanent track of everyone who logs on to the system, and what functions they perform. This historical record – which again can only be viewed by those with appropriate authority – is an excellent guard against fraud, and is also helpful to the dealer in analysing what has happened should the system apparently fail.

All in all, a very carefully thought out package, but what are the limitations? The only one I have been able to identify is the problem of Backup – making copies of your vital data to protect against data corruption or hardware failure. In this respect, *Orbit* is no worse than any other package, but I am surprised to find that it is no better.

Making daily backups is an essential, if annoying, discipline if you value the information on your system, and Vlasak say that their dealer training puts very strong emphasis on making customers aware of this.

But even the most disciplined of us would be inclined to overlook the process when time is short. My criticism is that *Orbit* contains no routines to remind you, force you or even check up on whether you have indeed made backups. All of this is a simple matter in programming terms.

There is a further problem connected with backup, which really is the fault of the hardware. The major drawback of Winchester disks is the lack of any suitable backup medium; Apple's Profile is no exception. Vlasak say the solution is to backup onto a second Profile unit, though I somehow doubt that many people will be prepared to shell out another £2,200 just for this purpose.

The alternative is to backup onto floppy disk but this takes, wait for it, *thirty five* disks each time – or at least forty minutes at the end of each day.

This process would be so prone to operator error and recording irregularities that the whole method must be in doubt.

The software suppliers would seem to be in something of a no-win situation on this score, and the onus is now on the hardware manufacturers to provide the solution.

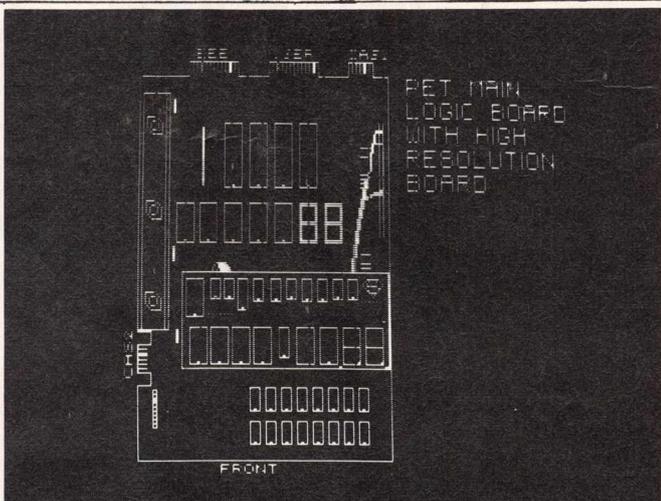

*Orbit* is without doubt a major step forward in business software and as such will do a great deal to improve the credibility of the micro for business use. For once the authors have thought several years ahead, and have approached the design from the outside in.

One facility, known as 'partitioning', allows you to assign a reference code of your own design to every transaction handled by the system. As it is possible to divide this code up into partitions designated perhaps as Salesman, Division and Product Group, it becomes possible to perform fairly complex and valuable analyses of your company's trading. Indeed, should you feel the need to enhance this feature, or tie it in to your own database, Vlasak will supply a 'toolkit' of information and routines with which to access the files of data, directly.

There are two features which must be unique, and they relate to security, both to preserve the integrity of your information and to guard against mishaps or fraud. As we noted in the January issue (*How to Buy a Business System*), such controls are sadly lacking in most commercial packages.

The first is a User Access Table. Each person who is to use the system must have their name and a unique password entered into this table. In addition, it must be specified precisely what each person is and is not to do. For example: Chloe the Clerk may enter an invoice and print out a statement but is not permitted to make adjustments. Higher up the scale, Alec the Accountant may print out reports/daybooks and alter account details, whilst only the Financial Controller can get access to the Final Accounts. At the top of the heap is a System Manager (who may even be the dealer) who is the only person allowed to re-configure the system, or make alterations to the user table.

Secondly, an internal function within the *Orbit* system keeps

How better to demonstrate a high resolution graphics board than with an illustration of same? Supersoft's new HR-40 fits inside 3000 series PETs; there is also a version for Fat-40 models. Price? £149 + VAT from Supersoft, 10-14 Canning Road, Wealdstone, Harrow, Middx. Note the different sizes of the character fonts – and the sideways lettering.

*The How-to magazine about Commodore's VIC-20*

There was once a Chinese Emperor who was very fond of games – so much so that his economy was practically run on 'game theory' and his politics on the 'theory of probability'. Promotion in the army depended on one's skill at chess and the most important Court Official was the Imperial Games Master. But it was at social functions that this pre-occupation really became nasty. Imperial party games became – literally – a matter of life or death. Once the rules were explained – as time went on the games became progressively more complicated – the poor wretched guests would nervously start to play. The secret for success was to play well enough to impress the Emperor but not well enough to beat him because this would result in a severe ticking off. In other words their heads would be removed. Losers would suffer the relative indignity of a loss of face rather than a loss of anything else but consistent losers would never be invited to the Palace again. This might not seem such a bad thing but they would also have all their lands and possessions removed!

### Tortuous exercise

I don't know if guests to my dinner parties in darkest Twickenham feel quite so threatened, but I certainly get some odd reactions when I phone them up to play a game of 'UK Politics 1984' or 'Waterloo' or some other tortuous exercise. "Oh a games party? What sort of games? I see.... well I'm not sure I'm very good at games really."

### Must you be an expert programmer?

I don't have any professional background in computing. My programming knowledge dates from the acquisition of the PET some four years ago and I learnt both from books as well as my own mistakes. Most of my programming is in BASIC but I do occasionally dabble in machine code sub-routines to save program execution time. I have always been more interested in games and 'game theory' than computing. I will admit, however, that computing has become a total addiction. Just ask my wife.

What they're actually saying is they don't want to make fools of themselves. And more to the point, nobody likes to lose at ANYTHING if there are witnesses. In our house even a game of 'Monopoly' can become a trial of strength and games like 'Diplomacy' can break up friendships quite easily. The thing which frightens most new-

comers is the presence of a PET computer. People are threatened by the unfamiliar and feel (with no justification) that the machine gives the home team – that's me – an advantage.

### What equipment is needed?

Not a lot. I have a faithful old PET which was one of the very first to arrive in the U.K. (old ROMs, integral cassette, upgraded from 8K RAM to 32K RAM). Disks are not essential for my simulations since all the programs and data are stored in RAM. I also use a Commodore printer and a Sound Box. A useful addition would be a UHF Modulator and a large TV display so all the players can see what is on the screen without craning their necks!

"But that's unfair" they cry, "you programmed it so you know how to beat us!" This is simply not true. All the games that we play with the micro really depend on people and their reactions to each other. The very fact that I appear to know more about computers than they do – plus the fact that I have invented the games themselves – means that all the other players inevitably 'gang up' against me and I will stand no chance at all. This happens with such monotonous regularity that I now act as a sort of Imperial games master. This has several advantages. On one occasion I was successfully bribed by two participants to offer advice (cheap at the price) and on another occasion I was the only person sufficiently relaxed to drink all the wine and enjoy the meal!

### New technology

You might well ask why anyone bothers to turn up at all if the entire evening becomes so fraught ... a sort of 'Ordeal by Dinner Party'. Perhaps all my friends are perverse in a masochistic way (if they're reading this then apologies!) I prefer to think it's because my wife is an excellent cook. Whatever the reasons, they DO turn up and we – mostly – have stayed friends afterwards. So what are these games and what does the computer do! I had better explain...

The first thing is that all the games are designed for the micro. I know it's quite possible to write programs for a computer to play 'Risk' or even 'Snakes and Ladders' but existing board games have survived for many years without such technical help, and in my experience, the computer tends to 'get in the way' of the game. Besides, 'Monopoly' on a small screen is a bore. New technology requires a new approach.

The second thing to remember is the whole aim of playing collective games. As I said earlier, the fun (if that's the right word) and the challenge come from the other participants. Games are about people and NOT machines. A bunch of humans staring blearily at a V.D.U. does not make for a good game. The excitement of playing on a machine so becomes a cross-eyed chore if the game can be better played across a table where everyone can see and talk to everyone else.

### Strategic position

Several of my games therefore feature a real board or map on a table with the computer looking on from the sidelines. Any moves made on the table are logged into the computer so the machine knows what's going on. It's far more satisfying to move your block of wood, brass counter or model soldier physically across the table and plonk it down with a menacing thud in a suitably strategic position. Presentation is important. With a little imagination – and very little cash – you can make the playing area attractive for the participants. Stretches of dyed green cotton wool do wonders for landscapes in war games. I never use tiny cardboard bits for markers; ends of wooden dowels suitably sawn up and varnished give the game a lot more authority. The other advantage is clarity. People can see the whole game layout at a glance and don't have to peer at a small glowing screen.

For example, there is one war game I play called 'Invasion' where 5-6 players each control NATO divisions. The map is a green baize cloth covered in 185 large hexagonals. Each hex has a number on it to make the job of computer input easier. The object is for the participants to help each other to stop a Warsaw Pact invasion of Western Europe. The computer plays the Soviet Union and also prints out combat results and news reports. The great advantage of having a computer is to work out the intricate mathematics of modern combat without recourse to charts, tables and dice rolling. Also the enemy only discloses the whereabouts of its forces as they are 'found' by the NATO players.

### Soviet silicon chip

This makes for a far more realistic game as the table display doesn't necessarily give the complete picture. Furthermore, all the players distrust the computer and so, by making the machine their enemy, they

**Humphrey Walwyn is  
a man who plays**

**VERY**

genuinely tend to fight the Soviet silicon chip. I have of course programmed it to make life pretty hard for the players involved and if the tide of red blocks reaches, say, Amsterdam, tempers fly. The point is that unless they work together there is very little hope of their winning. "Why didn't you support me?" is a favourite cry. As Armageddon approaches, you soon discover who your friends are.

One player – who is a military man in real life – once sacrificed the entire Belgian army to safeguard the Northern flank. "I'm only looking after my own interests" he remarked. I like to think that some of my simulations have no bearing on real life, but I'm not sure. It's easier to contemplate the destruction of half of Europe over a bottle of wine!

### Devising your own simulations

As I have said repeatedly in this article, games are about people. And people don't always trust or even like computers. Think of your game or simulation FIRST. Don't even begin to program until the game makes sense as an interactive exercise. Once you know what the basic rules are and the object of the game (e.g. is it to make more money than anyone else or does the winner simply have to survive?), then you will know what the role of the computer is. Make the rules SIMPLE. If it takes half an hour to explain to everyone what they're supposed to do, they'll lose interest. Lastly, always remember that people are fallible and will therefore make input typing errors (build in a number of fail-safe checks) and – no matter what they say – a surprising number of people will try to cheat. I use a second array of strings tied to each player's name that contains a password only known to that player so it's not possible to input someone else's moves!

### Socialists v. Thatcherites

On a less military but even more acrimonious note, there's a game of politics. The board in this case is a line of squares up and down which you move to show your political leanings. If you're over to the left you're a socialist and to the right you're a Thatcherite. Opposite each square are parliamentary constituencies which broadly respond to the political placing of your marker. The object is to win the election by trying to please as many constituencies as you can. The computer is the electorate and is informed of each move by each player as they scurry across the board. When election time arrives, the micro becomes a sort of TV 'election night special' with results and all voting figures (complete with a flashing CHANGE sign when an MP is displaced). Players may join each others' parties or set up their own party or do nothing and have a drink.

This game – which we have now played many times, and is the most successful of the lot – is definitely NOT for the faint hearted. I

did at one time let players choose real parties and express genuine political views. This led to two broken glasses and several people leaving 'rather early'. I now play with each player posing as an animal. We have brass horses, owls, dogs and others, and although some players still react in an animal fashion (!), I find that the game becomes more enjoyable when they don't have to put over real political views. If times get tough, you can always point out that they were bound to lose with a rabbit as Prime Minister!

### Professional interest

No one likes to lose, however, and the most common losers tend to be those with some professional interest in the subject being played. Inevitably in this game it is the quiet man from the bank or the drama secretary who will win. The politician guest won't get a chance. In a way it's like the guests' antipathy towards me – the games organiser. In a political game, they get distrustful of real political experts and freeze them out of the action. Could there be a lesson there that non-professionals make the best politicians?

I don't know but, from the number of times we've played the game, I offer the following pointers for success:

1. The party that splits up always comes off worst.
2. The party that steers for the middle ground between hard left and far right will always win if given enough momentum (SDP please note).
3. If in doubt do nothing. The electorate distrusts political fidgeting about.

We did have a local politician once who succeeded in doing very well. I then discovered he'd been bribing fellow contestants to vote for him. His animal was a lizard... he was rather embarrassed about it all and retired to drink his coffee in peace!

### Radio stations

The worst occasion of professional ineptitude occurred during a game of 'Radiomania'. In this game 10-12 players form their own radio stations and attempt to capture the largest audience. The computer asks them for their operational budgets, their media programme policy, the station's location and their 'star' presenters on the air (that's if you have enough money to have David Frost present your breakfast show!) When everyone has told the computer what they want, the machine prints out how many people would be listening to you. Surprise, surprise ... out of a room full of media and broadcasting people, the only two clear winners were a literary agent and a housewife.

"Computer error," I shouted and hastily did a bit of re-programming. But then they both

immediately repeated their success and completely wiped the board.

I'm therefore rapidly coming to the conclusion that in order to be good at something, it's better to know nothing about it at all. Tomorrow I shall burn all my computer textbooks and microprocessor manuals. That way I shall become a truly excellent computer programmer.

Of course it's only a game, but ....

### How to write the program

Before you do anything else, think out your game. Let's take a simplified example: imagine 4-6 players posing as rival companies supplying and selling energy to the U.K. The object, say, is to build and develop energy "factories" and make more money than anyone else. Once you've worked out all the rules and how the game will be played, then start to program. I always start by defining what I want out of the machine first. Let's say that energy will be measured in Kilowatt/hours. Each player will need the following variables: his name, a fail-safe code, the amount of money he has, and the total amount of energy in KWH he is producing. Each "factory" will need the following variables: who owns it, where it is, what sort of plant it is (wind, water, tide, solar, nuclear, etc.), its stage of development, its efficiency (% KWH/potential KWH), its cost, its potential for maximum KWH, its life time in years, etc....

Write all these down and then make a separate list of outside factors which may affect any of these variables. For example, weather, rising costs, National energy requirements over the next ten years and many more. Now comes the fun part .... start at the end and work backwards.

\* Who has won? The player with the most money.

\* Who has the most money? The player who produces the cheapest energy in sufficient quantities.

\* How much energy is each player producing? Each factory: Efficiency x Potential/Adverse weather (if applicable) etc.

\* How much is this energy costing each player? Running costs plus development costs (if in remote place), cost of connection to the grid.

\* What affects running costs? And so on.

\* What types of energy cost more to develop? How long does it take to develop?

All the facts you will need are available in your local reference library. I spend hours there before even sitting at the PET. "If in doubt, leave it out" is a good rule. Simplicity and moderate accuracy are vastly preferable to complexity and total un-playability. Not even the highly complex Treasury computer can apparently solve the country's financial problems, so what chance have you got on a micro?

Have fun doing it. If you get a buzz out of it, then the chances are your guests will too!

# SERIOUS GAMES

# TOMMY'S TIPS

## Scrolling down

I have had an interesting tip from Adam Gawne-Cain of Oxford. He has found a way to make the screen of a 3000 series PET scroll downwards. I am sure that all 40-column PET users are familiar with the fact that when you use the INSERT key to extend a program line over 40 characters when editing, the lower part of the screen scrolls down a line to make room for the new, longer line. Adam's program makes use of this in an original way.

```
1000 S$=CHR$(148)+CHR$(19)+CHR$(19) : REM HOME
+ TWO INSERTS
1010 PRINT CHR$(148);TAB(38);CHR$(160):PRINTS$
1020 POKE 225,128 : GOTO1010
```

Line 1010 prints a 'shifted space' character near the end of the top line of the screen, which should be blank for the best effect. The string S\$ contains a 'HOME' character and two INSERTs, which, when printed, push the shifted-space onto the next line, so BASIC makes the top line 80 characters long, and pushes the rest of the screen down one line. Line 1020 resets the top line to 40 characters.

## FOR Fixation

One problem I quite often see when reading programs written by beginners is a fixation with the FOR-loop. Some programmers seem to be extremely anxious to use the FOR-loop at every possible opportunity. For example, suppose I want to print a string, A\$, and then underline it with a row of asterisks. This is how it should NOT be done:

```
100 PRINT A$
110 FOR I=1 TO LEN(A$)
120 PRINT "*"
130 NEXT
```

A much more efficient method is this:

```
100 B$="*****"
110 PRINT A$
120 PRINT LEFT$(A$,LEN(A$))
```

Line 120 will select the right number of asterisks from the string B\$, depending on the length of A\$. You should be careful that B\$ is long enough to cope with the longest possible string in A\$.

This technique of printing part of a string of characters using LEFT\$ can be used in a great many ways. You can position the cursor on a particular line by setting up a string A\$ consisting of a HOME character and 24 cursor down characters. To move the cursor to line 15, just print LEFT\$(A\$,15). Similarly, if you have a string of 80 spaces called SP\$, this finds many uses when printing data, for 'padding' strings to separate columns, say or to blank out a message on the screen. Have a look at your latest program and see if you can make it a little bit faster by using this technique.

## From whence called...

Dear Tommy,  
I have an Apple and have been furiously beavering away trying to learn some advanced programming techniques. One tip I would love to have is this. I have a program containing a subroutine which is called from several points in the program. Is there any way I can find out the line which called the subroutine?

J. Gregory

The best way to do this is to have a variable, say LN, which holds the line number, and set this variable each time you call the subroutine:

```
100 LN=100 : GOSUB 1000
200 LN=200 : GOSUB 1000
300 END
1000 PRINT LN
1010 RETURN
```

You could write an assembler routine to PEEK at the stack, where the line number is held, but it really is not worth the effort.

## An imperfect match

Dear Tommy,

I notice that some sophisticated business programs allow you to do special types of string matching, such that JO?ES will find JONES and JOKES but not JIBES. I would like to incorporate this into one of my programs but I have no idea where to start. Can you help me in this please?

P. Davenport

Try this subroutine, which compares two strings, A\$ and B\$. The variable M is set to one if a match is found, otherwise it is set to zero:

```
1000 IF LEN(A$)<>LEN(B$) THEN M=0 : RETURN
1010 IF A$ = B$ THEN M=1 : RETURN
1020 FOR I=1 TO LEN (A$)
1030 X$=MID$(A$,I,1) : Y$=MID$(B$,I,1)
1040 IF X$=Y$ THEN 1070
1050 IF X$="?" OR Y$="?" THEN 1070
1060 M=0 : RETURN
1070 NEXT : M=1 : RETURN
```

## BASIC Restoration

Dear Tommy,

I do not really understand the need for the RESTORE statement when using DATA in a BASIC program. Also, is it possible to have several sets of DATA statements in a program and select which one applies at the start of a run?

R. Clarke

I must admit the RESTORE facility is not one I tend to use very much! The idea is that you can read all the DATA statements somewhere in your program, and then after using RESTORE you can read them all again. However, what I tend to do with DATA is to read it all into an array at the start of my program run, and then I can read it as many times as I want, forwards or backwards, or taking every third element as I please. As for 'selecting' DATA statements, this would in fact be one way of doing it. Say you have 4 sets of data, each set consisting of 10 elements. You could read the data into a 2-dimensional array, and by selecting one of the 4 rows of the array, select your data:

```
10 DIM A(4,10)
20 FOR I=1 TO 4 : FOR J=1 TO 10
30 READ A(I,J)
40 NEXT : NEXT
100 INPUT "SELECT DATA SET";DS
110 FOR I=1 TO 10
120 PRINT A(DS,I)
130 NEXT
```

This method has the advantage of flexibility in that if DS is

calculated by the program somewhere, because of a bug it may be incorrect. However, you can always change the value of DS as a direct statement as part of your debugging without restarting the program. Another way of selecting a set of data is to do some dummy READs to skip over unwanted data until you come to some you want:

```
10 INPUT "SELECT DATA SET";DS
20 FOR I=1 TO 10*(DS-1) : REM SKIP UNWANTED DATA
30 READ A
40 NEXT
100 FOR I=1 TO 10 : REM PRINT WANTED DATA
110 READ A : PRINT A
120 NEXT
```

**Underlinings**

*Dear Tommy,  
I am experimenting with a daisywheel printer on my PET 3032, but I am having difficulty with the underline character, CHR\$(95), which always prints a line below where I want it. Is there a way of underlining text without having to invest in a word processor?  
V. Hill*

The problem here is that normally, when you print a line, the PET sends a carriage return and line feed to the printer, which feeds it onto the next line. You will need to consult your printer manual for a control character which will perform a carriage return without advancing the paper. CHR\$(13) is the standard, provided your printer does not have 'Automatic Line Feed', which always performs a line feed after a carriage return. Assuming that CHR\$(13) will do the trick, then when you want to print a line containing some underlined characters, instead of, say:

```
PRINT#4,PL$
```

we use:

```
PRINT#PL$;CHR$(13);
```

exactly as you do for printing to a disk file. The trailing semicolon means that the PET does not send its normal carriage return and line feed, only the carriage return we are forcing with the CHR\$(13). After printing this line, the print head is at the start of the same line. You can now print the required number of spaces and underlines to achieve the effect you want.

This method is also useful for 'overprinting', printing one character over another to get some special effect, or printing a word twice to make it stand out, if your printer cannot do this automatically.

**Integer con**

*Dear Tommy,  
I have heard it said that integer variables in Applesoft are a 'con', because they are treated as floating point. Is this true, and if so what is the point? I always use integer variables wherever possible to try to save space, but it seems that I may be wasting my time!  
G.M. Burns*

I am afraid that you are right. The same is also true of the PET, and VIC, which also have a 'cut-price' Microsoft BASIC, but not some larger machines using a more expensive Microsoft BASIC. When an Apple uses an integer variable, it reserves five bytes in the variable table after the

variable name, as for a floating point variable, but three of these are not used. When Applesoft evaluates an expression containing integer variables, it first of all converts them to floating point. This is because the rules for evaluating an expression containing both integer and floating point values get very complicated. To cut a long story short, integer variables take up one byte extra every time they are used (the '%' sign), and are actually slower than floating point variables. The good news relates to integer arrays. Each element of an integer array only takes up two bytes, so you can save memory (if not time) by making larger arrays integer whenever possible.

**Loopy loop**

*Dear Tommy,  
After spending a long time trying to find a bug in my latest program, I eventually tracked it down to a FOR-loop which began:*

```
FOR I=1 TO N
```

*When N=0, the FOR-loop still executes! Is this a bug in BASIC, and if so, is there a way round it?*

*D. Stimple*

This problem is not really a bug, more a limitation of the particular BASIC you are using. Your BASIC only compares I and N when it reaches the corresponding NEXT statement, so whatever value N is the FOR-loop is always executed at least one. The only way round this is to test for N<1 before your FOR-loop:

```
10 IF N<1 THEN 100
20 FOR I=1 TO N
...
80 NEXT
100 ...
```

**Infallible memory**

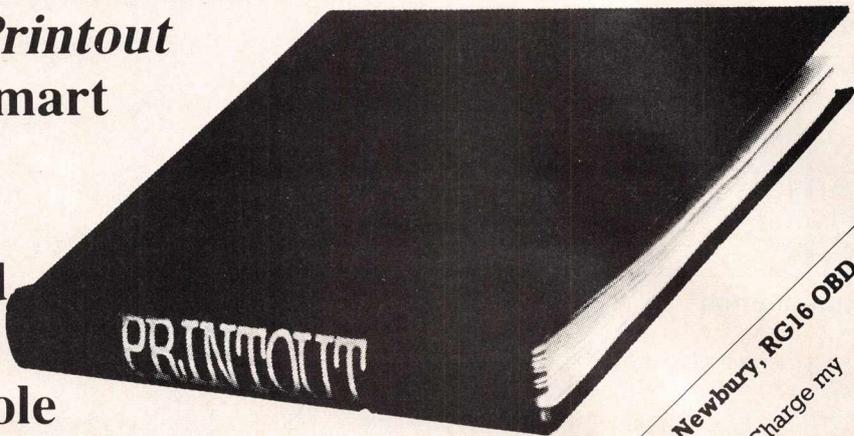

*Dear Tommy,  
With the current popularity of the VIC and ZX81, the computer mags are full of adverts for add-on goodies. Among these are memory units, which are described as either 'static' or 'dynamic' RAM. Is a static RAM one which does not lose its contents when the machine is turned off, and if so, can they be added to other machines, such as the PET or Apple?  
P. Hurst*

No such luck! A memory which keeps its contents is described as 'non-volatile'; most RAM is most definitely volatile, as those readers with small children are probably aware: What does this plug do, Daddy? (*Reply censored - Ed*). The only way to get non-volatile RAM is to arrange for the RAM chips to take their power supply from a battery which is permanently connected, rather than the normal computer power supply. This is used in the Apple's "CPS Multifunction Card" which, amongst other things, maintains the current date and time, even when the Apple is turned off. But on to your question about static and dynamic RAM. These terms refer to the actual circuitry inside the chip, which is much too complicated to go into here. All the important differences can be summarised in a little table:

STATIC		DYNAMIC
Low	Number of bits on a given area	High
High	Power consumption	Low
Fast	Access Time	Slow ▶

#### LION COMBINED PRESTEL TELETEXT VIEWDATA ADAPTOR MXV05

The Lion combined Prestel Teletext Viewdata Adaptor for Microcomputers MXV05 combines both Teletext and Prestel in one adaptor specifically for most popular microcomputers fitted with an RS232 interface. The unit is extremely versatile and based on our successful AXV03 television add-on adaptor less the infra red remote control, but with a bi-directional interface RS232.

The unit has full alphanumeric and editing ability, and software is available for most micro's to manipulate Teletex and Viewdata pages. All the normal Prestel and Teletext facilities are available with additional features:- Timed Teletext pages which will be essential on crowded Telesoftware pages planned from satellites, local editing for page preparation, 6 Autodial numbers, printer and cassette outputs and optional 8 page memory storage.

Full colour, full Viewdata and Teletext are available to micro's with RS232 out only, via the adaptor's UHF output, consequently the micro need not have Prestel Teletext character or graphics set and can operate in its own format with the minimum of software. Micros with full RS232 features have the ability to directly load free Teletext Telesoftware programs, prestel programs or from any private Viewdata software databases. e.g. Lion Viewdata Computer: As a special offer for an experimental period, purchasers will be allowed to market their software through the Lion Viewdata Computer or, at reduced rates, purchase programs directly from it.

# TOMMY'S TIPS

◀ One drawback of dynamic RAM is that it needs a little extra circuitry to 'refresh' itself, otherwise it starts to forget things. A bit like the Editor, except that he forgets things after he has been 'refreshed'!

## Flag day

Dear Tommy,

Could you please explain what a 'flag' is?

M. A. Ramsden

A flag is just a very simple kind of variable, which does not have a range of values: 1,2,3,4, etc., but only two values: YES and NO. It is normally used to pass information between programs, or between a peripheral and a program. For example, a printer connected to a computer may operate several flags inside the computer, such as BUSY, OUT OF PAPER and so on. When the computer sends a character to the printer, it will have to wait until the printer has printed it, printers being slow compared with a computer. To do this, the printer sets the BUSY flag until it is ready for another character. The computer can keep looking at the BUSY flag until it sees that the printer is ready for another character. If you watch athletics on the TV, you will see exactly the same system used by the officials in the relay races. The officials at the far side of the track are too far away to shout to the starter, so they wave a flag at him when all their athletes are ready. When all the flags are up the race can start.

## Saucy object code

Dear Tommy,

I thought that the terms source and object code only applied to assembler, but now I see them being used

referring to BASIC programs. Can you explain this please?

S. Mooney

These terms are not only applied to assembly language, but also to any compiled language such as PASCAL or FORTRAN. With the recent growth of BASIC compilers, the terms source code, meaning the original text keyed in by the programmer, and object code, which is produced by the assembler or compiler and actually executed by the processor, will be cropping up more and more often.

## We apologise for delays...

Dear Tommy,

I have seen a business program that advised you of the likely time involved in a major processing task such as a sort. How can the computer know in advance how long a calculation will take?

F. R. T. Ray

The computer cannot, but the programmer does (or should anyway!) The time taken for a sort, or an operation involving copying a number of records from one disk drive to another can be calculated fairly easily, so it is a simple task, if N records are involved, to write a line which says:

```
10 PRINT "THIS COPY WILL TAKE ";N/200;"MINUTES APPROX"
```

so you see it is all a big fiddle!

# CARING FOR YOU

Far too many problems with microcomputer systems – particularly in business applications – arise because the computer has not been properly cared for. The wrong environment or lax operating procedures can play havoc with sensitive devices like floppy disks. Now a new book has been published by microcomputer guru Dr. Rodney Zaks called “Don’t – or How to Care for your Computer” (SYBEX).

The contents cover subjects ranging from Security and Documentation to Printers. While the chapters on Hard Disks and The Computer Room are of more relevance to the minicomputer user, we can well recommend most of the procedures as being suitable for the business microcomputer user.

Here we have published several extracts from the book which you would do well to have pinned up on the wall by your computer.....

## Handling Diskettes

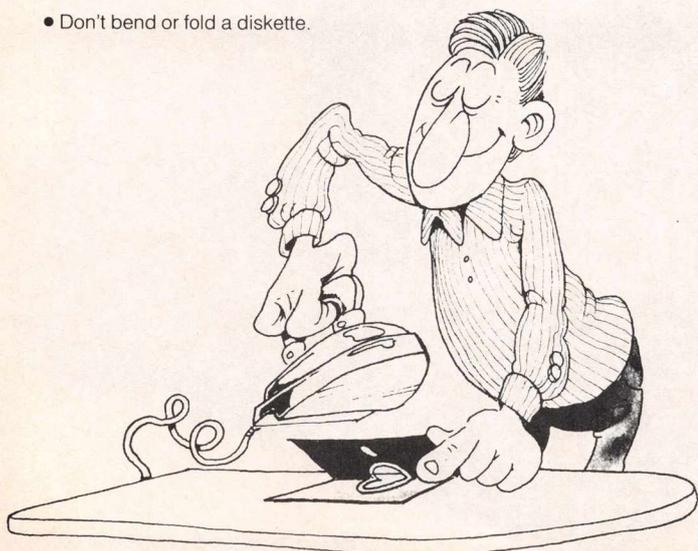

Once you understand the nature of your diskette and are aware of the main dangers, proper diskette handling is quite simple. Most importantly, you must respect the physical and magnetic integrity of your diskette.

Remember the four main characteristics of a diskette:

- It is fragile.
- The data is recorded on a magnetic surface, which is sensitive to electromagnetic fields.
- The magnetic surface is exposed to the environment through the openings in the jacket.
- There is only one correct way to insert a diskette.

Let us examine the rules resulting from these characteristics:

- Respect the physical integrity of a diskette.
- Don't bend or fold a diskette.

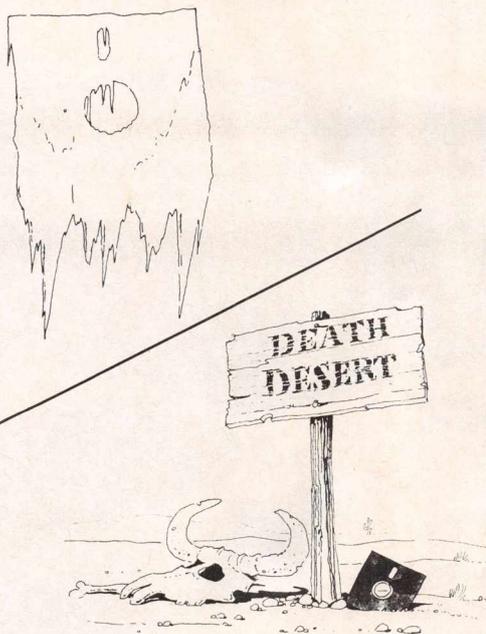

## ENVIRONMENT

Diskettes must be used in a proper environment. Here are the main enemies of your diskette:

- temperature extremes
- dust
- liquids and vapors
- electromagnetic interference.

Let us examine each of these constraints in turn.

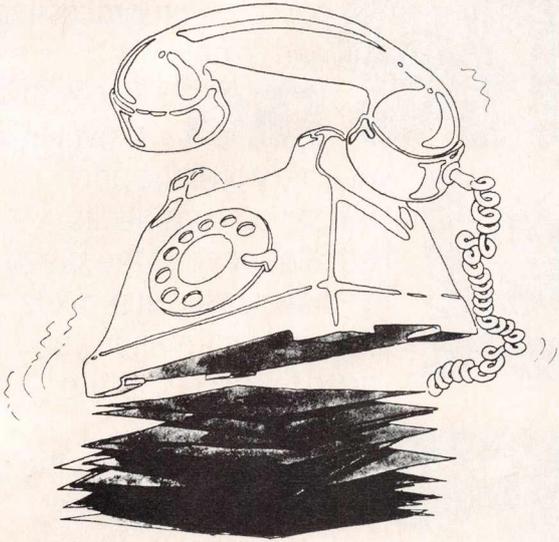

## Vapors

Avoid placing solvents close to diskettes as chemical fumes may affect the magnetic coating of a diskette. Dangerous fumes encountered in office environments include fluids for duplicating machines, nail polish, and some adhesives.

# UR COMPUTER

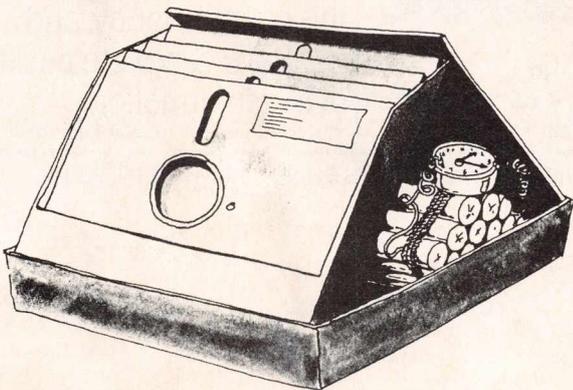

## Electrical and Electromagnetic Interference

Electromagnetic interference (EMI) is the name given to electromagnetic radiations that interfere with recorded data. Data can be destroyed or even wiped out entirely if a strong electromagnetic field or electrostatic field is applied to a diskette. Strong electromagnetic radiations are emitted by transformers and coils. A diskette should never be placed in close proximity to a magnetic coil (such as those used in telephones) or a degaussing coil (such as those around a color television tube).

## DON'T Let Them Lie Around

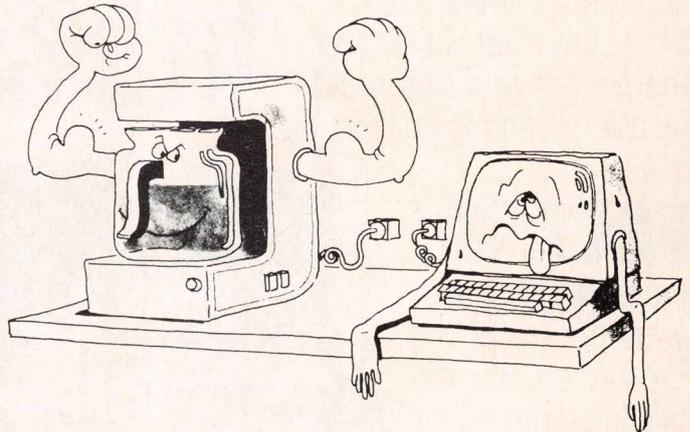

When not in use, a diskette should be stored in a protective envelope and preferably filed away. Leaving a diskette lying flat and unprotected on the top of your computer is an open invitation to disaster. Dust will accumulate on the diskette. Usually, no immediate effect will occur as the dust particles will be captured by the inner lining of the diskette. However, once more dust has accumulated, or pressure is applied to the lining of the disk jacket, one or more specks of dust will scratch the disk surface and damage data. Later on, when the data is used, because it is damaged, it will cause erratic system behavior and there will be no easy explanation for this behavior. Again, this is the time bomb effect.

## Power Supply

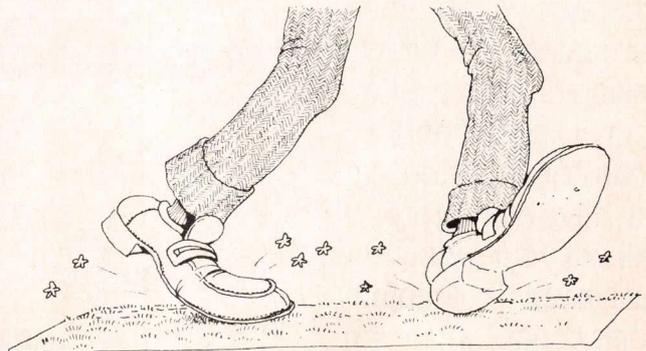

**Brownouts.** In some areas of the country, "brownouts" are common during period of heavy electrical use. During a brownout, the power company deliberately reduces the line voltage to avoid an overload situation. When this occurs, the voltage may drop by 8% (or even more). This drop will cause a computer failure. When brownouts are a problem, *power conditioners* must be used to restore sufficient voltage.

Short-lived brownouts can also be caused by switching on a powerful device that is connected to the same power line as your computer. This may occur within the computer room itself (for example, when a coffee pot is turned on), within the building itself (for example, when a vacuum cleaner is turned on), or sometimes because a large machine is turned on in a nearby building connected to the same power line. The flickering of the lights in the computer room is an obvious indication that a short duration brownout has occurred. Even a short-lived brownout will cause a computer malfunction.

**Static.** Interference with proper computer operation may also be caused by static electricity. Static electricity will disrupt the operation of any electronic component. On a dry day, 10 steps on a nylon rug can build up from 10,000 to 20,000 volts of static electricity in the body. By simply rising from a chair insulated from the floor (rubber casters), you can generate 10,000 volts. If you build up the voltage and point a finger at a component or a board you may "french fry" the component, i.e., cause its immediate destruction with a static electricity discharge. Touching a key on the keyboard, the frame or any peripheral of the computer, will cause a sufficient discharge to disrupt the computer's operation or even damage the computer permanently. Static electricity is a serious danger for any computer installation and should be carefully avoided.

We have examined all common electrical and environmental problems along with recommended procedures and precautions. We will now review the equipment available to correct these problems.

# When everyone offers you the 'perfect' business computer, how do you decide which is right?

**FACT:** The Sharp PC3201 is a sophisticated business computer.

**FACT:** The PC3201 is quite surprisingly simple to use. We'd guess that almost any member of your staff could be using it, and in no time at all.

**FACT:** Sharp offer a large range of software packages created by experts, like Microproducts Software Ltd., Holland Automation, Padmede Computer Services, Omega Systems and many more. CP/M\* is also available which further expands this range.

**FACT:** This comprehensive software range means that whatever your business, Accountancy or Agriculture, Baking or Building, Catering or Civil Engineering, Dentistry or Design, you can have a program, which will suit your requirements, such as book-keeping, stock control, invoicing,

# Get the facts!

payroll, wordprocessing and so on.

**FACT:** The PC3201 is available

at a very realistic price when you consider its advantages and the speed with which it can provide the vital information you need to succeed in the competitive '80s.

**FACT:** Sharp is the Japanese company with the history of technological innovation stretching back over seventy years. Every Sharp product has quality, reliability and value-for-money built in.

**FACT:** You could take your first step to greater efficiency in your business by clipping this coupon, today, and getting a complete package of free information.

# CARING FOR YOUR COMPUTER

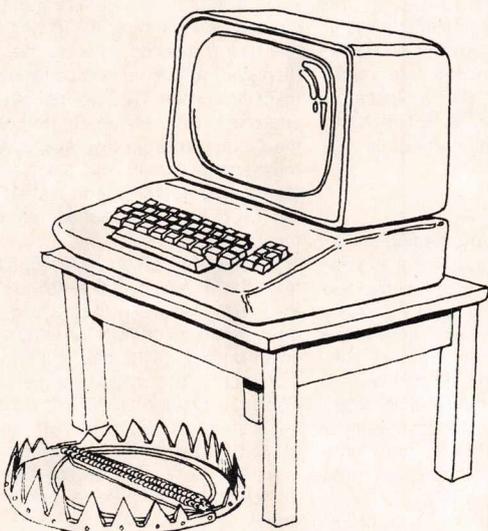

## Security

Securing information within and around a computer system can be accomplished by various means: psychological, legal, physical, organisational, and computerised (i.e., programmed). Some common methods will be reviewed here.

Programs and data must be secured against accidental damage and unauthorised access or copying. Preventing damage to a program or to data can be accomplished by following proper procedures. In particular, it can be accomplished by backing-up every new program received and by

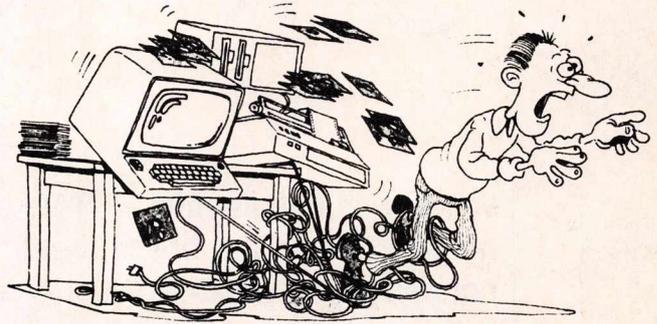

creating backup copies of new data. Physical protection of storage media such as disks and tapes is accomplished by storing them in an appropriate manner, as explained in previous chapters. Securing programs and data against unauthorised access is a more difficult task, but it can be achieved. In most cases, it can be done by erecting a variety of barriers.

When additional security is required, it is possible to use a program that records the time at which the computer is being used and the (alleged) name of the user.

Sophisticated operating systems and file management programs also allow users to protect their files selectively by making them read-only, executable-only, or even totally inaccessible except to the owner of the file. These features cannot be added by the user. They are part of the file system, i.e., generally part of the operating system.

## The Computer Room

### Routing The Cables

If certain items of equipment, such as the printer or the CRT terminal, are located away from the main computer, remember that the interconnection cables must be routed through secure and safe paths. Whenever this can be prevented, cables should not be left to lie on the floor. In an office environment, it is usually easiest to route long interconnection cables through the ceiling whenever space exists between soundproofing tiles and the actual masonry of the building. When such a procedure is used, the electrician should be told to avoid routing the cables next to power lines, light fixtures, powerful coils or transformers. In particular, interconnect cables should not be routed close to fluorescent fixtures.

### Dust and Liquids

Don't let dust or liquids come in contact with the computer equipment. It is best to disallow all liquids from the computer room. In addition, if a hard disk or a tape drive is used, it is best to disallow all smoking within the computer room. Sustained smoking in close proximity to a disk or tape drive will contaminate it. However, the likelihood of damage to a diskette is less than to a hard disk or tape.

Consider the following measures in order to keep dust out of the computer room:

- Seal all windows.
- Reduce traffic through the room.
- Keep coat racks outside the room.
- Don't allow your janitorial service to enter the computer room. Use a special lock.

# MEMORANDA

When was my meeting with Mike? Will I be back from holiday before the board meeting? How many more squash games before Christmas? Use *your* computer with *our* diary program to answer questions like these every day.

**M**EMORANDA, although written for a PET, is a personal diary program that is easily adaptable for use on most micros. Care has been taken to use only standard features and to eschew any that might cause conversion problems. Naturally, this has led to a compromise between the sophistication of the program and its convertability. With the suggestions for adding your own enhancements to the program, I hope that the end result will prove of use to a wide variety of micro owners.

By Bob Chappell

While aiming for simplicity, it was considered necessary to omit the use of data files since the way these are implemented varies considerably from micro to micro. Information vital to the program has therefore been stored in embedded DATA statements and read into arrays at the start of the program. This means that the user will need to insert his or her own personal data in these statements and will need to take a fresh copy of the program whenever any of these statements are changed.

## Birthdays & holidays

The personal information consists of three elements: the event (or memo) itself; the category type; and the date. The memo can consist of any characters and length, subject only to the limitations of your own micro. The category type consists of a single letter, being the initial letter of the categories you have set up. For example, B for birthdays, H for holidays, etc. It was felt that users would find this method far easier to use than having to remember the meanings of specific numeric codes. The only constraints are that the category letter should be unique, that H is not used since it is utilised within the program to deal with the special Holiday category and that there is enough room in the array to hold them.

The program has been set to hold 50

category names and 100 events, dates and categories. To use all 50 categories would mean using two-letter category types so it would probably be better to reduce the size of this array to something like 20 initially. All of the personal data array sizes can be changed without affecting any other part of the program since it recognises the limits of a set of data by reaching an asterisk (or any other unique character you wish to use) in the relevant DATA statements.

Category names are stored in the DATA statements starting at line 1130 and the end of this data is signified by an asterisk. The personal information is stored starting at lines 1150 and is in the format:

Memo, Category Letter, Start Date, Finish Date

The Start Date and Finish Date must be in the format DDMM where DD is the day number and MM the month number. Leading zero may be omitted from the day number but must be present in the month number, e.g. 8th June must be entered as 0806 or 806. The Finish Date is never entered except for the Holiday category where it is identified within the program by the presence of H as the category letter. Thus, a holiday entry might appear as MADRID,H,107,3107 while, say, a birthday entry might appear as BEN,B,1210. Again, the end of these memoranda is signified by an asterisk.

## DATA statements

The program commences by reading the information in the DATA statements into the appropriate arrays. The dates are converted into the total number of days from 1 January while the data is being read and stored, this method of holding the date information making searching simpler. The categories are then listed on the screen and the user invited to select one. In addition to the categories created by the user, the program generates two extra ones. The first of these allows the user to search on all categories at one pass. For instance, what memoranda are recorded for 1st June to 10th June, regardless of category?

The second extra category allows the user to search for a particular piece of text, from a

single character to a string as long as your micro will permit. If this option is selected, the user has the choice of searching only the leftmost portion (equivalent in length to the length of the string specified) of each micro or to search for the string of characters anywhere in each memoranda, e.g. both the former and the latter would pick up the memo GOLF AT 10.30 if GOLF was specified, but the former would not pick up this memo if OLF was specified since these are not the leading leftmost characters of the memo. The search for a string occurring anywhere in a memo is likely to be slow if there are a very large number of memos to be examined. A method of speeding this up is given under the Suggestions for Improvement.

## Searches

If a single category is selected, the search will only take place on that category (the "string" and "all category" options search all categories regardless). The user is then invited to supply a start and finish date range on which the search is to be limited. These are entered as day and month, and leading zeros are not necessary. Invalid dates are picked up and an error message displayed. If the memoranda cover a leap year then the 28 in line 1090 will need to be changed to 29. The program assumes all dates to be within the same year. If a single day is to be searched, the start and finish entries will be the same.

The program then uses this information (type of search and data range) to select all memoranda meeting these criteria. Only a few of the records meeting the criteria are displayed at a time, to prevent any scrolling up of the screen. The user indicates when the search is to continue. If no matches are made, the program displays an appropriate message. In either event, a message indicating that the search is complete is given and the user, at his indication returned to the menu.

The Holiday category is slightly different from the others. Since a holiday is likely to take place on more than a single day, the user, when inserting his data, can enter a finish date after the start date in the DATA statement. The program automatically recognises and handles this extra information by the H category. When a holiday memo is displayed, both start and finish dates are shown. Thus the user is saved from having to make 14 separate entries for a fortnight's holiday entry!

Whether a single category or special option, or single or range date is shown, the headings and displays are automatically adjusted to reflect this.

# A Personal Diary Program

## Absent mindedness

Although the program is liberally sprinkled with REM statements, these can safely be omitted as they are not referenced within the program. The Memoranda program, even without the improvements suggested, can be a valuable aid, particularly to those of us who suffer from recurrent absent-mindedness. The main snag is that we still have to remember to run the program regularly!

## Suggestions for improvement

1. To speed up searching of large amounts of data, particularly if the string search is to be used, the data could be sorted into date order at the start of the run and the start point found quickly, possibly by means of a "binary chop" routine. Equally, the search would finish immediately a record was found whose date was greater than the specified range.
2. The addition of files would make the program more useful. The user could then insert, delete and amend more conveniently. The old file would be read in at the start and a new file written at the end if changes had been made. For this purpose, disk files would be far more efficient (not to say faster and more reliable) than tape based files.
3. If disk files were used, there might be some advantage in accessing the file as it was needed rather than reading the whole file into memory. Data held in memory is faster to access but limits the amount of data available, simply because one is constrained by the limitations in memory size.
4. The program could be extended to cover more than one year and a facility added to delete old items and carry over fixed ones to the following year, e.g. birthdays and anniversaries.
5. On large files, a facility to abandon the search after a certain number of 'hits' had been made might be useful. With the sorting facility above, the data would always be presented in date order making this possibility more helpful.
6. A calendar facility could be added so that the program would also automatically tell you the name of the day of the week referenced. If it could also print out the whole calendar for any year, you would save quite a bit on Christmas presents, given you had a printer!

## Program Outline

Lines	Description
50-150	Present the categories on the

170-240	screen and obtain selection. If selected, obtain the string search criteria.
260-310	Obtain the date range (this is then converted into days).
330-630	Search for and display matches

## Subroutines

650-700	Heading routine - headings are displayed at each new screen.
720-740	Await a key press before continuing.
760-810	Date validation.
830-850	Convert day and month to total days.
870-890	Convert total days to day and month.
910-950	Error messages and delay loop
970-1080	Initialise and read data into arrays, converting dates to days.
1090	Data for number of days in each month.
1100-1110	Data giving names of the months.
1120-end	Category names data terminated by an asterisk, followed by Memoranda data (in the format Memo, category letter, date(s)) - this is also terminated by an asterisk. The user should substitute his own data here. As long as all the category names come first (plus an asterisk) and the memoranda data follows the above format, category names and memoranda data can be in any order within themselves. The special category for holidays is recognised within the program only by the category letter. The user must therefore have this category starting with

an H in the category name or amend the references to "H" within the program to tie up with another category name, e.g. the category might be called Vacations and the category type would then be V. The user does not have to have this category and could delete all references to the second element of array TD.

The only special PET facility used is the reversed heart which is the character for Clear Screen.

## Arrays

DM	- number of days per month.
M\$	- names of the months.
CL\$	- names of the categories.
E\$	- the memoranda (events).
C\$	- category type per memo.
TD	- memo date expressed as ddmml (day and month). Element 1 contains the start date, element 2 the finish date (element 2 only used for the Holiday category). These dates are converted at the start of the program from the ddmml format to total number of days from 1st January.

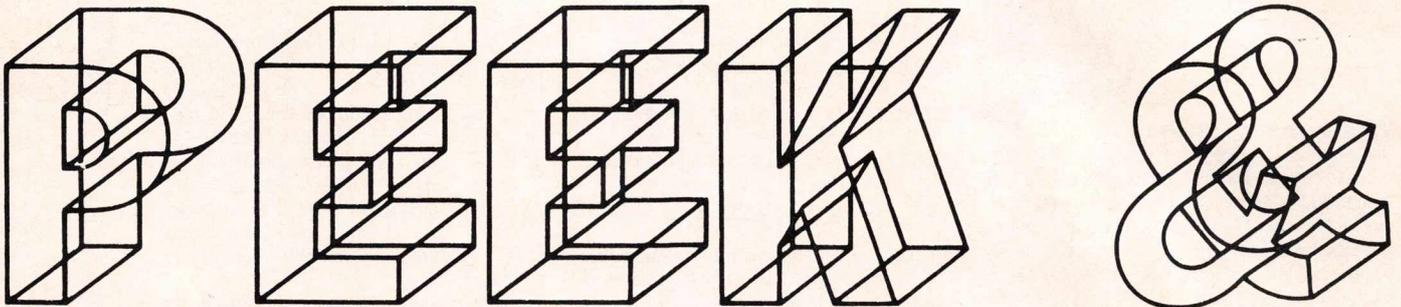

## Major Variables

TC	- total number of categories
TE	- total number of events (memoranda).
SD	- start date expressed as total days from 1 Jan.
FD	- finish date expressed as total days from 1 Jan.
Z	- = 0 if only one category selected. = 1 if all categories selected. = 2 if string search on leftmost part of memo selected = 3 if string search on whole memo selected.

# What are PEEK and POKE and how do you use them on the ZX81? **Tim Hartnell** unravels two more of the computer world's mysteries with the aid of a draughts program and some Space Invaders.

While many aspects of BASIC are relatively easy to grasp, PEEK and POKE can prove harder to understand. This article will, hopefully, remove a little of the fog surrounding the two words.

There are two ways PEEK and POKE are often used on the ZX81 – to store (and retrieve) information, and to put things on the screen, or check to see what is on the screen at a particular position.

I'd like you to imagine that the 'brain' of the ZX81 is the sorting room of a post office.

There is a slot for every envelope that comes into the post office, and each slot is marked with an address – a number – which corresponds to the number on the envelope. You can look inside (PEEK into) an envelope, if you know where to find it by knowing its address, or you can put something (POKE it) into an envelope.

That is, when you want to look at what is in a particular envelope, or the contents of the envelope at a specific address, you PEEK into it; and you POKE into the envelope when you want to put something at that address. This may still seem foggy, but bear with me, try out the examples, and it should become clearer.

Every part of a program you type into your ZX81 is stored at a specific address. In the following program, for example, the question mark after the word REM in line 10 is stored at the address 16514. The second question mark is stored at address 16515 and the third question mark is stored at address number 16516.

Enter the program now, and run it a number of times, looking at line 10 each time the program LISTS.

```

10 REM ???
20 LET A=16514
30 LET B=A+1
40 LET C=B+1
50 LET D=INT (RND*56+2)
60 POKE A,D
70 POKE B,D-1
80 POKE C,D+1
90 LIST
    
```

Amazing, isn't it? The computer POKES (using lines 60 and 80) a series of three characters into the addresses 16514, 16515 and 16516. The address 16514 is always the first address after the word REM in the first line of a ZX81 program. The equivalent address on the ZX80 is 16427.

This can be used in practice by storing some

information in the REM statement, and later looking at it using POKE. Type in, as a direct command, PRINT PEEK 16514, and you'll get the number of the character which is first after the word REM in line 10. Enter, also as a direct command, PRINT CHR\$(PEEK 16514) and you'll get the character which appears first after the word REM in the first line of the program.

## Draughts board

In this next program, DRAUGHTS, the board is stored in the first REM statement. As the game progresses, the changed board is POKEd into the first REM statement, and from this (using the routine from line 425 to line 470) is then PRINTed out, using the PEEKs of line 450. When the human player moves, the move is POKEd into line 10 using the routine line 220 to 250, and then the board is reprinted using the routine 425 to 470. When the computer moves, its move is POKEd into line 10 with the routine starting at line 400. The REM statement, as you'll see if you interrupt the game while it is in progress, changes after each move.

If you want to play a new game, the first REM statement must be changed back to the starting positions of a game of DRAUGHTS, so the routine at 5050 to 5070 PEEKs into the second REM statement (item by item) and POKEs this into line 10. As you'll see when you RUN this program, the whole PEEK/POKE process is remarkably quick.

You move by entering the number of the line down the side where your piece is, followed by the number across of the square. You will then get the prompt TO? and then you enter the number down and across of the square you wish to move that piece to. If you capture a computer piece, you'll be asked CAN YOU MOVE AGAIN? (that is, can you make a further capture). If you cannot, simply hit NEWLINE. If you can, hit any key and then NEWLINE.

You'll find this program plays pretty well at the beginning but tends to fall away a bit at the end. You may like to teach it to play a little better.

So, from this program, we can see that PEEK and POKE are useful for storing and retrieving information.

They can also be used to get and put information in the display file, which holds what will appear on the screen. Enter and run the following little program, which makes a character move randomly – more or less diagonally – on the screen.

# ZX81

# POKE

5*PEEK 16397,K
140 IF RND>.85 THEN LET K=K+1
150 GOTO 60

```

Lines 60 and 130 are the important ones, which show you how to use PEEK to find out where to POKE. That is, the routine (PEEK 16396 + 256\*PEEK 16397) finds out where the display file start address is, and the other part (33\*A + B + 1) counts along the screen to the place where you want to go. Line 60 POKes a character 151 into the screen, and line 130 POKes another character into the same spot. The POKE position is then changed, and a new 151 is POKed into place. This leaves an irregular trail of changing letters

# THE COMING REVOLUTION IN FARMING

Farmers are wellknown for their conservative practices – so what impact is the microcomputer having on one of Britain’s most productive industries? **Martin Hayman** dons wellington boots to find out.....

Many agriculturalists – if not the more traditional farmers – now refer to farming as an industry. This is understandable in the case of the so-called 'concrete farms', characteristically pigs and poultry, which are run under strictly controlled environments indoors. But what about the mixed general farm so beloved of the city dweller? Whatever happened to the shepherd with his flock, his pipes, his heart full of love?

### Decision making

Today's farmer in Britain is part of one of our most efficient, productive and certainly largest industrial sectors. The total turnover in England and Wales is £8,000 million a year. Today's farmer is as likely to be a hard-nosed businessman as anyone sitting in an air-conditioned office. The fact that he is wearing muddy boots does not diminish his need for business planning aids, of which the microcomputer is undoubtedly one of the most important. Because of the nature of his holding he is likelier to be able to deploy a micro to good advantage.

It may well be his own property; even if it is not, as a manager, his mistakes are likely to be glaringly obvious where those of a middle manager in a corporate business enterprise might be concealed. His decision-making is probably as time-critical as in the motor industry: he can't afford to have the wrong product at the wrong time. He's hedged around with rules and regulations: the Common Market may have conferred some advantages by way of grants, but it has increased his paperwork enormously. And, like any other enterprise which demands, at various points throughout the production cycle, large inputs of cash, he needs to know exactly how and when to borrow to maximum advantage.

Expensive money is bad news for farmers: at November 1981, farmers in England and Wales owed the Big Five high street banks £3,500 million. This is not merely for capital equipment replacement (though, with a standard Ford tractor edging above £10,000 and a combine harvester up to £50,000, this is an important factor) but for running costs – fertilizer and feedstuffs. If a farmer has, say, borrowed at current rate in November on the basis of a good return on his crop the following season, it is critical that he be able to predict what margin he is going to be left with when he sells his product. That is exactly the sort of area for which financial modelling software is so effective, so it comes as no surprise to find that one of the most useful aids around is a dedicated Visicalc for farmers, called, not surprisingly, Agricalc.

### On-farm computers

A popular image of the farmer is that he is both conservative and secretive. In both respects the microcomputer suits him well. It is no longer a novelty but a mainstream technology; and it frees him from the need to commit more than a fraction of the information on which he makes his decisions to outsiders. The emphasis in computing for farms has changed over the last decade. Large-scale planning exercises on mainframes, such as the Ministry of Agriculture's Reading installation,

are losing ground fast to 'on-farm computers'. ICI's Mascot system, for instance, was used around 1,000 times in 1970-9. Its disadvantages were manifest. An adviser would be despatched to collect data from the farm, taking one day. Local oddities would then be sorted out by head office, taking another half-day. Then a skilled agriculturalist would need to be on the case to explain the conclusions of this 'linear planning' activity to the farmer, and to discuss methods of implementation. It can be seen that if indeed the farmer is jealous of his independence and of his personal working methods, such an approach might lack appeal. Nevertheless, its principal areas of application have direct relevance; many microcomputer applications are descended from mainframe techniques.

Mascot offered programs to analyse:

- correct cropping and stocking
- the effect of a new crop or livestock enterprise on the farm
- the effect of cost and price changes, including a sensitivity analysis
- labour/machinery substitution
- the effect of increasing or decreasing farm size
- the costs and benefits of co-operation

### Increasing automation

There are several areas here which no longer interest farmers so much as when Mascot was first written. There is less enthusiasm for capital investment; co-operation is not such a burning issue, although the number of holdings has declined to around 100,000 in England and Wales; and mechanisation in a large arable farm has in many cases reached its limit – that is, it is not possible to shed any more labour. The specialised, concrete-based farms are a different matter although here, as in certain other areas such as dairying, microprocessor technology (rather than microcomputer) may still have scope for increasing automation.

The three main areas in which the mainframe had its uses are, however, equally applicable to microcomputer techniques. They are: decision-making, planning and control. To take them in order: decision-making is the process of choosing one of a number of options, based on a combination of knowledge and judgement. Such decisions may be strategic or tactical. Increasing the acreage of one crop would be a strategic decision; it would have repercussions on other parts of the farm system. Tactical decisions, on the other hand, are those which are made from day to day, involving perhaps allocation of feedstuffs or the source of purchase of fertilizers. The effects of such decisions would be localised but would necessarily impact the overall budget and profitability. The advantage of a computer system in the decision-making process is to compel a more disciplined approach to gathering information, permitting more accurate and swifter judgement. Previously, according to Richard Esslemont and T. Rehman of the University of Reading's Farm Management Unit, who have written a penetrating analysis of the subject, farm managers have tended "to rely upon rules of thumb or a keen observation of their neighbour's successes".

### Cash flow

Planning is to decision making as metaphysics is to physics; that is to say, it is a commitment to adopt certain decision-making processes in order to achieve a sense of purpose. Long-range 'optimisation' computer techniques such as Mascot are generally too remote to interest the average farmer but more limited – and conventional – techniques such as Cash Flow are especially useful to farmers.

Cash flow forecasting is not generally programmed so as to seek maximum profit but it does allow several different propositions to be evaluated, often as far ahead as three years, and a profit-and-loss account to be drawn up. In practice this means that the security-free loans which are promoted by feedstuff manufacturers and banks can be compared for their long-term effectiveness for a particular set of circumstances. Esslemont and Rehman suggest that farmers can thereby benefit by changing the timing of purchases and sales; changing farm policy; studying the costs and benefits of various sources of finance; planning tax payments – in fact the usual panoply of 'what-if' questions familiar to any user of Visicalc. Clearly, in order to benefit from such a computer application, the farmer must already have committed himself to serious and detailed consideration of the way he assesses the business performance of the farm. Clearly, the better a farmer is organised with respect to specific business methods, the greater the productivity improvements likely to be conferred by 'going computer'.

### Specific reminders

What about the variable factors which are particular to farming? Rehman and Esslemont suggest that "Plans for spraying cereals, harvesting potatoes, silage making or planning to hire a new farm foreman will not involve the use of computers and programs as we understand them now", but in future this is the direction which farm systems will take.

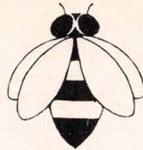

The arithmetical elements of projection on the basis of current performance are not hard to program, but more specific reminders that, for example, "the bulk tank capacity is overloaded by a new plan for milk production or when an animal's limited dry matter intake cannot cope with the daily rations that form the foundation of the plan" are useful aids to improve judgement and remind the systems user that the exercise has real constraints – and would also improve confidence on the part of the sceptical farmer who has previously tended to make his plans by hunch. They recommend therefore that when a farmer proposes to buy a computer system, he uses some foresight and specifies some planning and budgeting capability to help him plan, as well as tackling the standard requirements of accounting and payroll.

The third area where a micro can be of use to a farmer is in controlling the business. This is a day-to-day exercise which to many people characterises the role of the manager. By contrast with the modelling system which allows targets to be set for planning purposes, control systems interact directly with the actual work of the farm, and may to some extent supplant the supervision

of the manager on the spot, though not entirely. Some farm systems are being developed which make, for example, dairying a semi-automated process, but these are in an early state of development and are not reliable enough to supplant skilled labour at this time. (See panel). But in some areas the financial type of analysis characteristic of office planning may feed back information which helps to eradicate bad or inefficient practices which have become ingrained with the passage of time. "The process of food production at the farm level has not yet been so automated as to make control an office and paper operation. A balance between this type of control and on-the-spot supervision is necessary," observe Esslemont and Rehman.

**Reactive judgements**

Since this type of application is reactive, it must be capable of integrating easily into the farmer's life and demand little in the way of computing ability on his part. Obviously, too, robustness is of the essence. This means plain, easy-to-read instructions and maximum simplicity of data entry, and easily understood printouts which contain only the information needed to make reactive judgements. Since control measures current performance against previous performance, a database of past performance must be built up and this will involve keying in records for the type of activity in which the farm specialises.

This is an area which in the past has argued the involvement of external specialists, maybe a bureau operator but as systems for farmers become cheaper and software more sophisticated (i.e. easier to use) engaging external specialists has become less favoured. Systems supply for farms is a booming business. Where in 1979 Esslemont and Rehman feel unable to recommend any more than six specialist suppliers of software and systems, the Agricultural Development and Advisory Service listed 20 such suppliers at the end of 1981. Mr Keith Butterworth, one of ADAS's Regional Farm Management

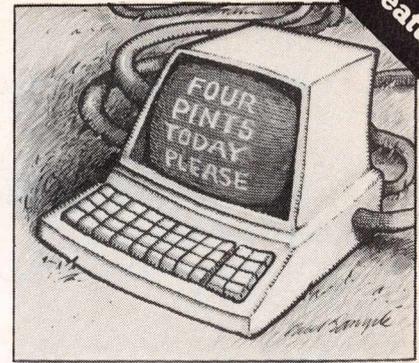

Advisers based in Newcastle-upon-Tyne, said that such suppliers were likelier to have their roots in farming than in computing – much the same story as we hear from most users of applications software, where the likelier success stories are from those software houses which understand the client's needs thoroughly and speak his language.

**System brief**

One expert who specialises in farming systems is Dr. Charlie Pugh, who originally trained with the Reading University Farm Unit, and went on, via experience in Canada, to become a computing consultant to farmers and also runs his own dairy business in Cornwall. In a recent pair of articles in the specialist journal *Power Farming*, Dr. Pugh evaluated, on paper, several quoted systems which had been submitted, as if for tender, to the magazine. The brief for the system was for an extensive holding of four farms, to which a fifth was shortly to be added. The computer was to take the following functions in hand: records and information required per farm for financial control (yearly, monthly, current and stock control); enterprise monitoring for dairy cows, pigs and for ration formulation and feed planning; and for Payroll. Five companies invited to tender were also asked to state their policy with regard to program maintenance; machine maintenance; staff training; guarantee

period; payment terms and conditions of contract; updating and expansion of the system.

The detailed results, well worth reading for any farmer seriously considering a micro and how to go about specifying his own needs, were published in *Power Farming* (October/November 1980). Quotations were received from Farndata, Farmfax, Farmplan, Farm Systems and Parwest and showed a wide variety of approaches to hardware, support training and guarantee. Three of the firms offered more or less pre-packaged systems based on Apple II Plus or Tandy TRS-80 micros, equipped with a variety of

peripherals but inevitably at least two disk drives. In all cases at least 48K RAM was specified; the two more expensive, custom-designed systems suggested 64K and, as a possible option for the better-heeled, a hard disk, which pushed the price of this Zilog-based system up to around the £17,000 mark. These, note, are summer 1980 prices; the hard disk option may now be cheaper. It should certainly be considered. The disadvantages of numerous floppies lying around a farm office could be considerable.

**Test drive**

Dr. Pugh, who commented on the usefulness of the systems, makes the point that it is extremely difficult to compare paper specs; a thorough test-drive is recommended, along with serious discussion with the proposed supplier about his maintenance terms and training. The best computer system in the world is no good unless the driver understands how to use it. He recommends: "Obtain expert advice on whether your farm can justify a computer system and will be able to deal with its operation. If at all possible, have a trial with one or more systems. At least a month of intensive use is needed. Check out how long your proposed supplier has been in business. See at least two which are broadly similar to your set-up. Check their results, particularly the back-up services of training, maintenance and up-dating which are critical to successful installation."

The sort of comparison exercise suggested by Dr. Pugh may be difficult to organise among such a traditionally secretive group as farmers, though it is notable that Farmplan, who offered the Apple system, suggested that software support could be taken care of via their Users Group at the very reasonable subscription price of £250 a year – much less than the other quotes.

But in short, the message is "Beware". There are many pitfalls in buying a micro for business if you are a first-time user: many of the sellers are first-time suppliers. There are more cowboys around than in Marlboro country (I refer to the micro suppliers, not the dairy farm). A recent report by the University of Lancaster, *Small Computers in Small Companies*, finds that in a 100 case studies of small businesses, a quarter of those who had installed a micro had experienced installation problems and nearly three out of five had had some kind of hardware or software problem in the first six months; three-quarters found that their system, a typical cost of which was around £15,000, so hardly of negligible cost, had broken down at some time. Generally

speaking, hardware breakdowns were covered by a service contract, usually at around 10% of purchase cost, but software was a different story: here three out of five said they had had some problems, and only half would agree that it had been an unqualified success.

### Small-scale calculation

An easier way in might well be to adopt the "small is beautiful" approach. ADAS has developed its original computer-based work

with its Hewlett Packard HP 10s for the HP30 and 31 hand-held programmable calculator and sells a range of application-specific programs for a minimal price. They have now changed their allegiance and most regional farm advisers now carry a Texas Instruments TI59. Details of these can be had from ADAS's local advisers, who are also the contact point for working "up the tree" to the more specific and expert advice which can be had from the specialist On-Farm Computing Team, whose chief is Peter Russell in Reading. This sort of small-scale calculation aid, while obviously of no use for payroll and planning applications, can nevertheless bring savings on, for example, fertilizer purchase and use. Farmers talk about the "treadmill of technology"; once the land is heavily supported with chemical fertilizers, the process becomes irreversible and their continued use mandatory. Yet studies in the US have shown that as much as 35% of agrichemicals there go to waste – by mistiming the application, or using the wrong kind, or even applying when the wind will blow it into the hedgerows.

moment likely to be run by, and hence tied to, certain large agrichemical concerns, such as CIBA-Geigy or BOCM, or quasi-governmental organisations such as the Milk Marketing Board or the Pig Marketing Board.

### Green Thumb

Some useful progress has been made in this area by the Danes, who have a form of distributed data processing for farmers in Schleswig-Holstein, by the French with Teletel (though what use it can be to the notoriously conservative peasant farmers of France is questionable), by the Canadians with their Manitoba "Grassroots" project, and by the Americans with "Green Thumb". The latter is especially interesting. The "Green Thumb" box is made by Tandy and sits on the TV set as a videotex adaptor. About 100 were distributed by the University in Kentucky City to Kansas farmers, who would only be able to access information on the database after submitting a local weather report. This sort of trade-off of information looks a promising way forward. The following firms are listed by ADAS as suppliers of systems for farmers. New firms are constantly being added to the list; for latest details, as well as further information on suppliers' specialities and general advice on farm microcomputing, contact Keith Butterworth at Newcastle-upon-Tyne (0632) 869811 or at Leeds (0532) 674411.

ADAS publishes two helpful booklets, the first general, *Introduction to On-Farm Computing*, the second specific, a list of suppliers from which this information is drawn, *Systems and Programs*.

## CASE STUDY

Bridget's Farm, a holding of 300 dairy cows, could be described as a "farm of the future". It is an attempt to apply microprocessor technology to the fullest extent to control dairying, which itself has received much attention from farm computing experts since the Ministry of Agriculture's Daisy herd management system was written for the Department's mainframe at Reading. It is funded jointly by the National Institute of Agricultural Engineers and Elsmere Electronics, a subsidiary of Forward and Bland, the milking machine manufacturers, which is typical of the kind of links between government-backed research institutes and private industry, characteristic of the best of British agriculture.

### Environment problems

Bridget's Farm, at Marshworthy near Winchester, features AFMS80 – Automated Farm Management System for the 1980s – a prototype, perhaps, for total micro control of types of work which have hitherto been regarded as beyond the scope of electronic technology because of the environmental problem. "Once you take the microprocessor into the environment of the cow, you've got an altogether different system," remarked the farm director, Edwin Mundy.

Each cow is identified by a radio-controlled "transponder" slung around its neck, which identifies the cow to the micro on its arrival in the milking parlour. Its milk yield is automatically measured and is then input direct to the micro, giving an individual milk record for each cow. The beast is then fed with a given level of food concentrate programmed by the micro; finally it is weighed on an automatic weighbridge which rejects obviously erroneous data (a variation of plus or minus 30Kg – six legs on the weighbridge).

Mr. Mundy originally envisaged that the system would be fully implemented after about 18 months but progress has been slower than anticipated, principally because electronics and high-pressure hoses do not mix well. The transponders have needed more insulation, and there have been problems with the radio signal in an all-metal building. Progress on the software has also been rather slower than expected: the daily event action list program has yet to be implemented. There have been rather more breakdowns than usual in the recent cold weather. But despite the problems, about which Mr. Mundy is quite frank, at least one farmer has taken up the system which, like most micro systems, is likely to yield closer control, better information and hence better productivity.

### Telesoftware

Alternatively, some farmers may prefer to wait, if their computing needs are not immediate, for the likely developments in videotex. For the user who needs to access a program only once a week, say, there is little point in purchasing a £15,000 system when the program he wants may be available as a telesoftware routine. Farmers are exactly the sort of business sector which British Telecom hopes to woo with Prestel, and there are already several specialist databases for farmers, including IPC's Agriview, which gives up-to-the-minute reports on the prices fetched by stock, the purchase price of fertilizers and feedstuffs, and the prices fetched at second-hand auctions of farm machinery. With a certain amount of local processing power, or even by using large-scale processing power accessed through Gateway, farmers could have a tailor-made service to, say, give them a guide price for a certain item of machinery on the second-hand market, or the most advantageous rates for certain kinds of fertilizer. These developments, however, rest on the provision of sizeable agricultural databases which are at the

# Who Needs Maths Anyway ?

Is it possible to learn about computers without a working knowledge of mathematics? Yes – say the manufacturers. No – says **Richard Nichols**, after five disastrous days with a ZX81.

It might have been W.C. Fields (and if it wasn't, it should have been) who said 'If at first you don't succeed – quit.' I have a feeling that he was speaking directly to me. It's a fact that some people are infuriatingly blessed with that instinctive understanding which grants them a carefree and intimate relationship with all things mechanical. Remember the Fonz? In *Happy Days*? When the jukebox stopped and all attempts at restarting it failed he would simply touch it and away it went. I, and most others, I suspect, would have been in the ignorant and helpless crowd looking on, marvelling at his rapport, his style, and the ease with which he manages gadgets. Also at the fact that his christian name is Arthur, but that's another story.

### Trepidation

Now that you've got the general picture you can see that it was with some trepidation that I decided that a computer of some

description was rapidly becoming vital to the cause. The cause, in this case, being a book. Research for this project has been taking place in a rather haphazard manner for the past three years, but then it's a complex book, and minor trivia such as earning a living have tended to intrude somewhat. Even so the amount of material amassed so far has gradually become a heap of exceedingly tatty bits of paper, newspaper cuttings and cigarette-packet memos to myself which, exposed to the inclemency of the mobile junkpile I choose to call home, has all the integrity and consistence of a *Tiswas* script.

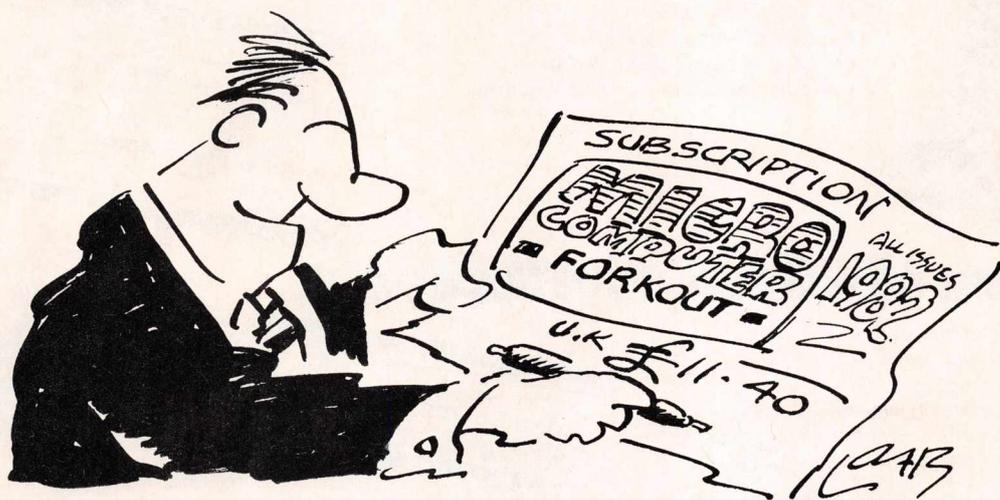

What was called for was a method of storing all this information in a manner which neither I nor my haphazard approach to life in general could disrupt. Further benefits to be gained from the computer were also evident. Having once stored the relevant facts they could be recalled at will in almost any order or combination which I desired

and the program allowed. Since the book is tied to a 24-hour timespan through and around which several variable factors and characters revolve, it would make sense to write the program accordingly. Then, when all the information was in place, tied to the time-base, I could simply press the relevant buttons and demand to know the precise location and condition of A at any moment, or the location and condition of B at the same moment. I could even pick a moment and demand to know where everybody was, and what they were up to. In this way it appeared that I could arrange for the computer to do all the work; I need only type out the results and collect the fame and fortune at the end of it. Which is as it should be.

### Series of profanities

It needn't be a big computer, since it was only required to perform the one task and could then pass swiftly into happy ▶

# Microcomputer Budget Beaters

On all orders placed before March 31st 1982

Adda Computers are one of Commodore's selected officially appointed key dealers. Guaranteeing product knowledge and straight, fair dealing. Now we've put together a microcomputer system package which offers substantial discounts over normal list prices. All these are standard Commodore units—tried and proved in everyday use. You can rely on Adda. Everything we sell is thoroughly tested, and we back it with our reputation. Even at budget prices!

## The Commodore Pet 4000 series (4032/4016)

- ★ Integrated Unit
- ★ Full size keyboard
- ★ Separate numeric keyboard
- ★ BASIC available on power up
- ★ Exterior peripheral handling capability

4016 Normal list price £550  
**Adda Budget Beater £434**  
Adda budget price incl VAT £499.10  
4032 Normal list price £695  
**Adda Budget Beater £549**  
Adda budget price incl VAT £631.35

## Commodore 4040 dual drive floppy disk

- ★ Stores up to 340K bytes of information
- ★ Uses standard 5 1/4" floppy disks
- ★ Direct connection to IEEE port
- ★ Self contained disk operating system
- ★ Dual drive unit for security copying
- ★ Single-sided disk recording for greatest reliability

4040 Normal list price £695  
**Adda Budget Beater £549**  
Adda budget price incl VAT £631.35

## Commodore 4022 dot matrix tractor printer

- ★ Low cost matrix printer
- ★ Full PET graphics capability
- ★ Reverse characters (white on black)
- ★ Expanded printing for headings etc.
- ★ Direct connection to your PET's IEEE port

4022 Normal list price £395  
**Adda Budget Beater £312**  
Adda budget price incl VAT £358.80

Commodore 4021 simple dot matrix printer

# SALE ELECTRONIC GAMES

**NOW £40 OFF**

## ATARI T.V. GAME

THE GAME WITH 50 CARTRIDGES  
R.R.P. £129.95 (inc. VAT)

**OUR PRICE**  
**£78.22 + VAT**

(= £89.95 inc. VAT)

The Atari is supplied with a free mains adaptor, a pair of paddles, a pair of joysticks and a combat cartridge and is the most popular television game on the market and has a range of over 40 different cartridges. In addition to the standard Atari range we also now stock the new Activision cartridges which are currently on special offer reduced from £18.95 to **£16.95 inc. VAT**

### ATARI CARTRIDGES

20% OFF R.R.P.

Atari Soccer £29.95

**NOW £23.95**

Activision Dragster £18.95

**NOW £14.95**

Activision Boxing £18.95

**NOW £14.95**

**ATARI OWNERS CLUB** — Why not join our **FREE** Silica Atari Owners Club and receive our bi-monthly newsletter with special offers and details of the latest new cartridge releases. Telephone us with your name and address and we will add your name to our computer mailing list.

## MATTEL INTELLIVISION

THE ULTIMATE T.V. GAME  
R.R.P. £229.95 (inc. VAT)

**OUR PRICE**  
**£156.48 + VAT**

(£179.95 inc. VAT)

6 NEW CARTRIDGES JUST RELEASED:  
**ASTROSMASH \* SNAFU \* BOWLING  
SPACE ARMADA \* BOXING  
TRIPLE ACTION**

All 19 current cartridges + the six new ones above now retail at £19.95 — **Silica special offer price £17.95 inc VAT**

**NOW £50 OFF**

The Mattel Intellivision is the most advanced T.V. game in the world with a range of over 25 different cartridges all at our special offer price of £17.95. This game uses a 16-bit microprocessor giving 16 colours and three-part harmony sound. The picture quality is incredible with 3D effects and realistic animation. An add-on keyboard will be available in the Spring 1982 to convert the Mattel into a full home computer with 16K RAM which will be fully expandable and programmable in Microsoft Basic. Other accessories will be added later in the year. The normal price of the Intellivision + free soccer cartridge is £229.95 but our special offer price is £179.95 inc. VAT saving you £50.00.

**MATTEL OWNERS CLUB** — Why not join our Mattel Owners Club and receive our regular newsletters containing details of all the latest cartridge releases. Telephone us with your name and addresses and we will add your name to our computer mailing list.

**FREE 16 PAGE CARTRIDGE CATALOGUE** — If you are interested in owning a Mattel, we now have available a 16 page catalogue describing the latest six cartridges to be released, as well as a new Mattel colour leaflet with brief descriptions of all 25 cartridges. Telephone us for further details.

## T.V. GAME CARTRIDGES

We specialise in the whole range of T.V. games and sell cartridges for the following games: **ATARI \* MATTEL \* ACETRONIC \* PHILIPS \* DATABASE \* ROWTRON \* INTERTON \* TELENG**. Let us know if you own any of these games and we will let you have details of the range of cartridges available.

Attention INTERTON & ACETRONIC owners we have over 75 assorted used cartridges in stock all with 1 year guarantee — **SPECIAL OFFER £8.95 each**

We also have a number of secondhand games and cartridges.

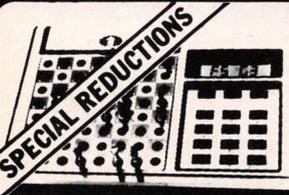

**NOW £8 OFF**

## EARTH INVADERS

These invaders are a breed of creature hitherto unknown to man. They cannot be killed by traditional methods — they must be buried. The battle is conducted in a maze where squads of aliens chase home troops. The only way of eliminating them is by digging holes and burying them.

R.R.P. £26.95 **NOW £18.95 inc. VAT**

**SPECIAL REDUCTIONS**

## ELECTRONIC CHESS

Liquid crystal battery chess computer with 100-200 hrs battery life and two levels of play. Comes with separate chess board and pieces.

**NOW £5 OFF**

R.R.P. £24.95

**SALE PRICE**

**£19.95**

(inc. VAT)

## GRADUATE CHESS

A de luxe version of the electronic chess set with integral chess board. The ideal portable chess set — see illustration.

**NOW**

**£29.95**

INC VAT

## FIDELITY MINI-SENSORY CHESS COMPUTER

The very first chess computer of its price to offer a portable computer with integral sensory board. Battery (6-8 hrs) or mains operated. This is a modular game and additional plug-in modules are planned for 1982 for advanced chess, popular openings, greatest master games, draughts and reversi.

**MINI-SENSORY COMPUTER WITH STANDARD CHESS MODULE** WAS £54.50 **NOW £49.95 INC VAT**

Silica Shop are one of the country's leading specialists in Chess Computers and now stock a range of more than 20 Chess Computers, including Challenger 7/10/voice, Sensory 8 and Sensory Voice, Diplomat, System 3, Morphy, Great Game Machine, Voice Champion, and the new Sciencs Mark V.

**NOW £10 OFF**

## PAC MAN 2

Pac Man 2 is based on the latest pub game. It is a two-colour game of strategy, tactical pursuit and destruction pitting Pac Man against the large Ghosts. The object of the game is for Pac Man to attain as high a score as possible by capturing and destroying Ghosts, Bugs and Energizers without being himself destroyed by the Ghosts. Pac Man 2 incorporates the most modern and complex status displays ever produced and is now on release for the first in the UK offering an ideal present.

R.R.P. £34.95 **NOW £24.95 inc. VAT**

**NOW £8 OFF**

## SPACE INVADERS

Based on one of the most popular arcade games, Space Invader™ packs in lots of action with multi-shaped, brilliant LED vessels, including attack ships, bombs, defenders, missile rockets and a beam force cannon, plus exciting electronic sound effects. The attack ships attempt to bomb the ground defenders as they are moving. You manoeuvre the missile rockets — avoiding alien bombs — and destroy the invader force as quickly as you can. Progressive degree of difficulty. Includes automatic digital scoring. For ages 6 to adult.

R.R.P. £24.95 **NOW £16.95 inc. VAT**

**LESS THAN 1/2 PRICE**

**COLOUR CARTRIDGE T.V. GAME**  
Semi Programmable T.V. game  
+ 4 cartridges  
\* mains transformer  
**NOW £43.50 OFF**

# Who Needs Maths Anyway?

On the part of the pupil to have anything to do with sums. I've got on very well without them up until now, and I see no good reason to alter this habit in order to gain the submission and obedience of a collection of silicon chips at this advanced period in life. The second, and I'm not too reserved to point it out, is the rather inadequate instruction book which comes with the ZX.

## Groping in the dark.

Criticism of this tome falls in two parts. One of them you are, having read this far, already familiar with and that is the obstinate refusal of the author of the said instruction book to introduce purchasers to their new toy via any means other than a strictly mathematical approach, during which the square root of the cosine of the price of one egg may be correctly determined by reasonably simple means. Quite why any sane person should entertain such an obviously unhealthy interest in the various functions of the price of an egg (or any other form of dairy produce for that matter), is, like the mathematics involved, entirely beyond my comprehension. The other is obvious enough, given the book's overwhelming concern for, and relish of, obscure mathematical tricks. The English is faulty, and equally obscure. Which means that even if I had a basic knowledge of sums I

may well be groping in the dark a bit.

Add that to a strange mix of priorities (why aren't the correcting of mistakes and erasure of unwanted data explained right at the start?) and the total misconception that pupils not only understand sums but are possessed of a perverted desire to perform them on the unlikeliest of subjects, and you can see that computers are not that easy. The method is clear. This is how you add two and two. Easy. But teaching you how to use the computer by showing you how to do sums is all very well if you understand sums to begin with. I don't. Neither do I understand the ZX81, and I've been playing with it for five solid days. PRINT TAN(45/180\*PI) gives you tan 45(1). Fine, if you know that tan 45(1) is to begin with.

## Storing words

To be honest and fair, which after five days of mental gymnastics with this plastic demon is the last thing I feel like being, it gets easier later. But even then, when you get on to strings, which are at least words, and therefore comprehensible to simple people, they are not left unscathed by the interfering hand of the numerate magician who wrote the instruction book. Having taught the pupil to store words in the machine he then goes on to show you how the computer can ascribe a numerical value to each string in order that you may compare one with the other and also, presumably, discover without trouble the square of the sine of the length of a string.

Gradually I am beginning to understand the plight of Patrick McGoohan, relentlessly

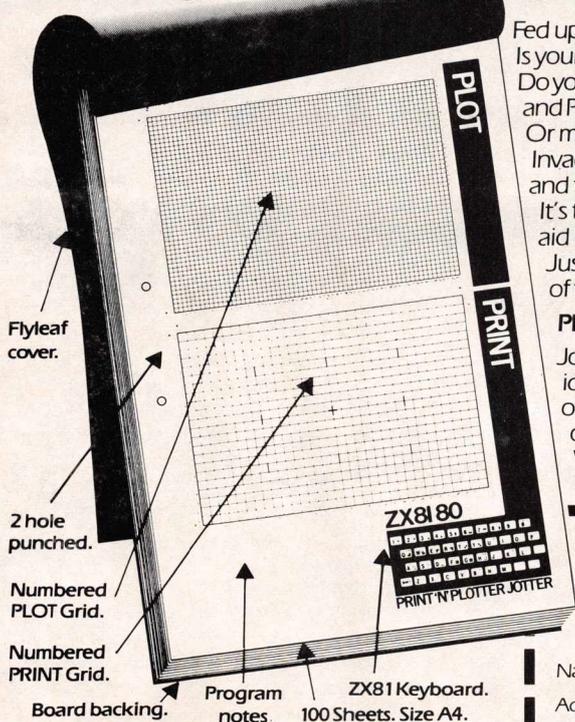

pursued across the sands of Port Merion or wherever, by that vast plastic bubble, who insisted for at least 13 Episodes of *The Prisoner* that he was not a number. Even such a distinguished opponent of Big Brother and the computer age was finally sucked into the gaping maw of the computer, however. After weeks of determined avowals to the effect that he retained personality above digits, he was still found asking 'Who is number one?' Had he been taken in, or what?

## Big Brother

With 1984 just around the corner, and Big Brother probably the geezer behind you in the bus queue, it looks as if computers have already taken over the world. I am forced to face this fact. I already know that I exist only as a number to computers all over the country; at the DVLC, the Inland Revenue, DHSS, TVLRO, my employers and even the wonderful credit card company which allowed the purchase of the ZX 81 in the first place. And the conspiracy doesn't stop there, because it now seems that even my own personal computer regards me simply as a number. It hurts me to realise that my own computer could tell you the sine of the square of its owner. To be honest I was becoming more or less resigned to being only a number. But I draw the line at being the sine of the square of myself.

# HOW TO GET SERIOUS ABOUT ZX GRAPHICS FOR ONLY £3.50

Also available 'over the counter' at Denry's Booksellers, 2 Carthusian St., London EC1. Buffer Micro Shop 374a Streatham High Rd. London SW16.

Fed up with listings that ignore the graphic approach? Is your PRINTING and PLOTTING still guesswork? Do you want to write data programs with graphic PRINT AT and PLOT and professional looking 'windows' and 'scrolls'? Or maybe you're still trying to find the successor to Space Invaders! All you need is ingenuity... and the **PRINT 'N' PLOTTER JOTTER**.

It's the professionally-produced ZX Graphics-aid designed by enthusiasts... for enthusiasts. Just take a look at the specification - then think of the possibilities for **real** graphic graphics!

## PRINT 'N' PLOTTER FILM TOO - FOR ONLY £2.25!

Jotter 'FILM' is a matt Polyester film version of the "JOTTER" Grids identical in size so you can co-ordinate **precisely** PRINT and PLOT or you can copy photographs, drawings, maps, charts! The surface of the film is ideal for drawing (with pencil) and erasure.

With both JOTTER and FILM the graphics possibilities are enormous - despite low resolution. Isn't it time you got serious about ZX Graphics?

Post to Butler, Currie & Hook, 19 Borough High Street, London SE1 9SE.

Please send me \_\_\_\_\_ "Jotters" @ £3.50 (inc VAT, P&P)

Please send me \_\_\_\_\_ "Films" @ £2.25 (inc VAT, P&P)

Please send me your illustrated leaflet - I enclose a stamp.

Please bill my Access/Barclaycard No: \_\_\_\_\_

Name \_\_\_\_\_

Address \_\_\_\_\_

Post Code \_\_\_\_\_

All goods are despatched within 48 hours of receipt. If you require 1st Class return post please add 50p to 'Jotter' price.

## State-of-the-Art Report :

# DO YOU NEED DATABASE?

What is a database, and should you be using one? **John Gowans** investigates this growing market and concludes that you have to be very careful indeed when buying a database package.....

I admit defeat. My Synonym Finder, that much-used source of so much elegant variation, has no record of 'database'. 'Data' and 'base', yes, but no trace of their trendy combination. We're going to have to get at a definition from other directions, and if you think you've seen jargon before, you ain't seen nothing till you see some of the phrases concocted by database definers.

For instance, try this one on your pianola: "It is essentially a one-to-many relationship between records. It may be supported by pointer chains, indexes, or physical contiguity, or implied by the presence of corresponding key fields." Meat and drink to the database whizz – it is obviously a definition of the word 'set'. The Synonym Finder didn't tell me this either; it comes from a glossary written by a skilled Scicon man around four years ago, and I defy any beginner to figure it out.

### Theoretical constructs

But you can understand the definers' problems. For a start, databases – and the database management systems that run them – are theoretical constructs that have little to do with physical reality, like degree-level mathematics. In my University maths course, the lecturer restrained himself from using numbers in an example because we hadn't defined what a number was; in this case the number '2'. These higher plans need rigour in their definitions, and although you might think you know what a number is you would have a tough job writing your definition down with the precision required. No wonder I packed in my maths degree.

This theoretical digression is meant as a kind of warning to readers who want to find out about database management from the primary sources, notably the 1971 report of the Conference on Data Systems Languages (Codasyl). It is tough going, and makes no concessions to the uninitiated. Let's hope this *MicroComputer Printout* attempt is a bit clearer.

First off, databases themselves. In common parlance the term is used to mean any collection of data about anything, replacing the older 'data bank' that used to be applied to computer systems the writer or speaker didn't approve of – viz, "I'm recorded in the police data banks." But a database is really a

collection of data that is related in various ways and which can be interrogated in various ways through the database management system programs. We'll go into the relationships and the interrogation later, but for now the big point is that the data in a database is stored in a structure that makes it easier to get the information you need out of the computer. The user need have no idea how and where the data is physically stored, but only needs to work out the structure that suits his data and the information he needs to extract from it.

It is the structure of the prospective database that causes all the theoretical tangles and dumbfounding definitions, since this is the abstract construct that needs translation into reality if you are ever going to get what you want on the screen or printer. And if you are going to buy one of the increasing number of self-styled database management packages on the market, the structures it allows you to create must be the major concern.

These packages are designed simply to let the user get answers to any questions he wants to ask about the data he has stored. For instance, if you were running a computer magazine you might have file of subscribers's names and addresses; a file of contributors and the subjects they've written about; a complete index of what's been published in the magazine since the year dot; and a file of payments made to contributors – all ready to go on the computer. But this information needs to be organised so that you can ask questions like "How many subscribers are there in Devon with subscriptions expiring in May?", or "Which contributors have written articles published about the Apple, are not subscribers, and have not been paid for two years?" (sorry Richard, no offence). If you organise it properly, a database and its management system would be able to give you fast answers to these and many other more ludicrous questions.

### Self-styled

The observant reader will have noticed the phrase 'self-styled' applied to database management systems on the market. This is not intended as a sideswipe at software firms, but as another warning to the reader – many of these products come nowhere near the Codasyl specification for such systems,

good though they may be. We have got to draw lines somewhere.

The first thing to figure out is whether you need a database management system – henceforth shortened to DBMS – for your application. It's a new area in computing, particular in microcomputing, and computers were manipulating files of data long before the DBMS appeared. Old is not necessarily bad, and perhaps your data lends itself to old methods. Before going on to the different types of DBMS (both Codasyl and non-Codasyl), let's look at tried and tested techniques of organising your data storage.

In days of old, when tapes were sold, serial and sequential files ruled OK. In the first, records – that is, little blocks of related bits of data – are stored one after another on the reel of tape, jammed up together, and in no particular order. In the second, the files are made up of records jammed together in an order determined by one item in each record; by one customer number, account number, or part number for example. Serial files are fine for things like payroll, where you have to go through the whole set of records anyway to do payslips, updating the amounts as you go, but for answering queries about particular records they are useless. If, say, you had a serial file of names and addresses you would have to go through the whole file to find the postcode for one address.

### Key items

Sequential files made this kind of thing easier, thanks to the Indexed Sequential Access method (ISAM). As described above, sequential files have their records sorted into order depending on some key item or other; and a separate index file is formed to contain a list of the key items together with their locations in the main file. So, if you want to find the address of a customer whose record is stored using customer number as a key, all you have to do is put in the right number for that customer. The computer will sort through the index file, find whereabouts in the main file the record with the number is, and go straight there to get it out for you.

But even ISAM makes some unwarranted assumptions about the questions you are going to ask about your data. Such as, in the example just described it is assumed that you know the customer number that goes with the record you want to look at. And if, in

# State-of-the-Art Report :

the same example, you wanted to get a list of customers who lived in Manchester, or who owed more than £500, you just couldn't do it without looking through the entire main file for the little relevant lumps of data.

So how can database systems help? The main thing is that they let you get at the same data by different routes, so that you don't need to know the one key fact about what you want — the customer number for example.

The simplest form of a DBMS for microcomputers uses a simple structure which is called various things like a file type database, an inverted database, or multi-index database. These definitions are a real bind. This structure is the one most commonly used in microcomputer databases, and at any one time the user has access to just one big file ordered like a sequential file according to the value of one key item in each record. But, and here it is a big but, the user is not restricted to searching through just one index file. A number of items in each record can be used as retrieval keys, and each item chosen as a key has its own index file so the computer can find particular occurrences.

## Reports

You might have noticed that explaining this kind of thing leads you into all kinds of corners. Let's have an example: Say you're still in business as a computer magazine proprietor, and you have a big file of subscribers (you hope) made up of records consisting of name, address, and the date the subscription was taken out. Now, with this database you can say that the name, the town part of the address, and the month part of the subscription date are the keys, and tell the computer that. It creates index files for each, as described earlier; and then you can find out things and produce what are called reports — really the answers to the questions you want to ask about the data. For instance, you could sort the file into alphabetical order of subscriber name, or into chronological order of subscription date. You could look for all occurrences of 'Bristol' in the addresses, and print out the associated names. You could make a list of all subscribers whose subscriptions will expire in the next three months. And all this without having to know where any of the information is stored, just the structure and the search keys you have imposed on it.

Most commercial packages have this kind of database management, including Jinsam from Hini Micro-Systems of Riverdale, New York — this runs on the Commodore PET, and if the company's adverts are to be believed it has been "selected by NASA, Kennedy Space Center, With Multiple Applications Related to the Columbia Space Shuttle Project." The capitals are theirs, the meaning is anyone's guess.

Others of this type are Microconductor for Microcomputer Technology, which runs on the TRS-80 and the Apple II; Information Master from High Technology for the Apple; and Profile I, II, and III for the TRS-80; this last is put together by Radio Shack itself. Nor are State-of-the-Art packages restricted to US origin, with many good examples coming from software houses in this country. A glance through the advertisements of this

magazine would be productive, though I cite DMS, The Administrator, and Silicon Office as good examples.

## Esoteric structures

You will certainly discover that the prices vary a lot even for this simple type of system, and this confusion will continue. The trouble is that you are not just paying for the information storage and retrieval facilities, although that might be all you get in the really cheap DBMS. You have to check up on a lot of other things as well; whether you can choose the format you enter data in and the format in which your reports are printed out; whether the DBMS interfaces to other programs like WordStar for word processing or mathematical routines for doing calculations on the data; how easy it is to command the system to get the data you want out of it; and what kind of fiddling around with files it lets you do.

This is one field where what you get does not necessarily depend on what you pay, since some commercial DBMS packages might be slow at sorting and retrieving data but have wonderful editing and formatting facilities — one good example of this is the Information Master package for the Apple already mentioned. But one thing you can be sure of is that once you move into the more esoteric database structures you are going to be paying a lot more.

The next step up from the simple systems we've looked at is an obvious one. They can only handle one file of records at a time, and the next batch can deal with more than one. This can be handy. For instance, in our example you could combine the subscribers file with the magazine contributors file, and do a combined search of both at once to find out, say, how many subscribers are contributors or vice versa, and create a cross-reference file showing this. And, of course, you could do searches and sorts on the contributors file in its own right.

There are fewer examples of this type of set-up. There is FMS-80 from Systems Plus of Mountain View in California, which runs on any CP/M machine and costs \$750; and Selector IV from Micro AP of San Ramon,

California, which also runs under CP/M and costs \$550.

## Real heavies

And finally come the real heavies, the relational and network DBMS packages. This is theoretical city Arizona, and much of the blame must be placed at the door of Dr. Edgar Codd, IBM's database king. He has been described as "the inventor and deity" of the relational approach, and the same source describes his work as "the piece of Codd that passeth understanding."

I'm glad I didn't say that. After all, I've got to try to explain the stuff.

Now the usual explanation of relational databases says that they allow the user to look at data as tables, however the data is stored on disk. I always find this a bit confusing, although the alternative — a structure that relates every item of a record to every other item of every other record — is not much better. Okay, let's try to see how it's done.

Not surprisingly, we start with a table, no surprise since in this context the word 'relation' means a two-dimensional table, like a two-dimensional array. This first table lays out all the data that will go on the database, with each column, being one of the key pieces of information that you might use. One example I've seen is a programming personnel file where the columns are the programmer's name, the languages he is familiar with, the number of years he has used each language, this job title, experience in the company, his hourly pay, the project he is working on, and the manager of each project.

Now if you start filling this table in, starting with the name column, you end up with a basic table of data. But this won't do for our relational structure, since each programmer can know more than one language and work on more than one project — and this violates the relational database rule that every column must have just one value in each row. For example, under 'language' you couldn't have a row with both Cobol and Fortran in it.

Rearranging the table to make this happen is the first stage in what is called normalisation; the next stage is to work out which col- ▶

Many people wrongly use the word Database in place of Databank — when referring to large collections of information used for purposes of which they don't approve.

# State-of-the-Art Report :

Columns depend on which other columns and then to split these up into other relations, each with its own key. Then, finally, you build up any other relations you need to get the information you need, and this final form is called the third normal form.

## Tables turned

This all sounds a bit of a mess. But what you end up with as your database structure is a set of two-dimensional tables showing different relationships between items of data. For instance, in the above example you end up with four tables: one has employee name, job title, experience, and pay as its columns; the next has employee, languages known, and language experience; the third has employee and the project worked on; and the last has the project name and the manager of the project.

Forgetting detail, the normalisation procedure gives you some set of tables, or relations, that enables you to get at anything you like, by extracting information from one relation and carrying this on to the next appropriate relation, and so on. In the example we are using, one question might be "What is the Cobol experience of senior programmers working on a project managed by such and such manager?" The DBMS could go to the project/manager relation to find which projects are managed by the particular manager; then to the name/job title/experience/pay relation to find which of these programmers has 'senior programmer' as his job title; and then to the name/language/language experience relation to find out whether the programmers know Cobol, and if so, what ex-

perience they have in that language. And, bob's your uncle, there is your answer.

Well, at least I've succeeded in showing you how complicated relational DBMSs have to be – and how careful the user has to be in designing the structure he wants in the first place.

There are very few relational DBMSs about for just this reason, especially (of course) for micros. Even IBM, Codd and all, has only just made a tentative step into relational systems with its recently-released SQL/DS. But there are a few, including the Condor Series 20/DBMS from Condor of Ann Arbor in Michigan, which runs on any Z80 machine and costs \$695; Quest from Software Products International of San Diego, which costs \$490; Request from United Software of America, which runs on the PET and the Apple and costs \$225 (I find myself doubting the relational qualities of a DBMS for that price, but there we are); Sequitur from Pacific Software, which runs only on the 16-bit Onyx hard disk micro under Unix and costs – wait for it – \$3,495 (I can believe that one); and dBase II for CP/M from Ashton-Tate, costing \$700. Several of these products are imported into the U.K. by individual dealers or software houses.

And now we come to the only Codasyl-compatible micro DBMS, from a company called, oddly enough, Micro Data Base Systems Inc. This is what is called a network database, as all Codasyl types are. With a network system the user can navigate his way through a set of files, jumping from one to another as required. For example, if the user is in a parts file at a particular parts number,

he could jump to the supplier/parts file to find the suppliers of that part, and then jump to the suppliers file to find the suppliers' address.

## Query language

MDBSI (the company) supplies its MDBS.DMS (the product) with the option of adding a program that provides a query language – a common feature in big computer DBMSs and on some micro versions. A query language is generally English-like, and allows the user to type in something like 'Find all parts numbered between 124 and 278 with a stock level between 100 and 200' and get the right answer.

The query language is the interface between the user and the DBMS, and in relational and network systems allows the user to navigate his way round the structure of files or relational tables without writing any retrieval programs.

This, believe it or not, is just scratching the surface of DBMS and database theory. The information revolution means that more and more data will need to be organised in more and more ways, and like it or not the micro will be at the sharp end.

Micro DBMSs are still in their infancy, but watch out for developments. And watch out for the advertising copy as well. Here's another goody: "can be a view of the data structure which differs from the basic physical hierarchy defined in the original database definition".

That forms part of a definition of the word 'logical'. I think I just flunked another test.

# SIMPLICALC

## FOR EVEN 8K PETS.....FROM CRONITE

**NEW!**

**For the first time, you can have a visual electronic calculator on even the smallest Commodore Pet, with no need for a disk drive.**

You can move your screen around on your electronic worksheet, adding and deleting and recalculating . . . and if you think that sounds familiar, you're right. SimpliCalc was written to provide the main facilities of programs like VisiCalc™ on machines which do not have the 32K and disk drive required for VisiCalc™. Now the real power of your micro can be harnessed at a quarter of the cost of larger programs.

- ★ **Runs even in 8K**
- ★ **Writes figures or alphabetic characters on your sheet**
- ★ **Allows easy change or deletion**
- ★ **Can save your sheet for future use**
- ★ **Lets you print out your sheet on PET printers**
- ★ **Uses cassette or disk**
- ★ **Allows formulae to be set up for rapid recalculation**
- ★ **Shows you your sheet on the screen all the time**
- ★ **Allows replication of columns and rows**

What can you use it for? It's limited only by your imagination; any tabular computation, especially where you want to adjust and recalculate, is ideal. The Cronite Group uses it for costing, modelling, consolidation and capital investment appraisals. Try these:

- ★ **Education — business studies and economics**
- ★ **Investment analysis**
- ★ **Household budgeting**
- ★ **Financial modelling and cash flow**
- ★ **Costing**
- ★ **Tax computations — personal or business**

To obtain your copy of this versatile numeric tool, with comprehensive manual, send cheque with order, specifying whether your CBM is ★ 2001/3000/early 4000 (PEEK (144) = 46) ★ late 4000 series ★ 8032 and whether you want cassette **£29.90 inc. VAT** or disk **£36.80 inc. VAT** (specify drive) to:

**SIMPLICALC — The Cronite Group Limited, Montgomery Street, Birmingham B11 1DT.**

**Further versions for other popular micros e.g. VIC 20 are planned; enquiries welcome.**

**Further details from Mark Turner on 021-773 8281 — telex 338247**

VisiCalc is a trade mark of Personal Software Inc.

# IT'S ALL DONE W

## How you can achieve some very sophisticated programming techniques using simple BASIC strings. Mike Gross-Niklaus explains .....

In the first part of "Strings and Things", the fundamental tools for handling strings were explained. You saw how to format output for any printer, how to split up strings containing packed information and how to scan a string character by character, together with an application which reversed first and surnames in a list.

In this article I will show you how I use strings to create sub-languages, call named subroutines, and pass groups of parameters to subroutines. While these techniques might be called sophisticated, the means of achieving them is quite simple, provided you have grasped the concepts described in the first part of this article.

### Creating sub-languages

Let's start by reviewing how you can use

string functions to bite off fixed length chunks of a given string. One application of this is a routine which returns the abbreviated month name, e.g. Jan, Mar, Dec, given the month number. The trick is to set up the ordered abbreviations in a string, ensuring that 3 letters, no more and no less, are used for each month's abbreviation. I create such a string in the preliminaries block of my programs.

```
1000 REM PRELIMINARIES
1010 DA$="JANFEBMARAPRPMAYJUNJUL
      AUGSEPOCTNOVDEC"
```

Then at any point thereafter in the program, the following expression will return the month abbreviation for month M in MN\$:-

```
5040 MN$=MID$(DA$,M*3-2,3)
```

This expression, you may recall, takes a substring out of DA\$, starting at M\*3-2, and taking 3 characters. Thus if M were 1, the substring would start at character 1\*3-2 (=1), so MN\$ will be "JAN", while if M were 8, the substring would start at character 8\*3-2 (=22), and MN\$ will be "AUG".

I use a similar technique to format reports extracted from a mass of information held in an array. Suppose for example, an array holds 25 figures and a parallel string array holds their titles or descriptions. And further suppose that I want in one report to print titles and figures for items 1,7,11,12 and 13 only, listed with the titles starting at column 1, and the figures starting at print column 40 with the exception of item 13's figure, which I want to start at print column 50. In other words, a typical financial report.

This we will assume is just one of several reports I may want to produce from the array. Another might require figures 13, 18 and 19 lined up at print column 40, figure 15 lined up at column 50 and figure 25 at column 60. Diagrams 1a and 1b show what the two reports might look like.

To do this using a separate routine for each report is wasteful of memory. For a combined routine however, we need a way of specifying what items are to be printed and in which column the figure field is to start. Provided these are available we can write one routine which selects and formats any sub-group of information from the arrays.

### Formatting string

The trick is to create a formatting string which the report-producing routine dissects or parses so as to obtain the details for selection and formatting. (*Parsing*, by the way, is the jargon word for testing whether a set of characters form a logical command and interpreting what action is to be taken.) Provided you write a parsing routine to match, you can use whatever conventions you like in this formatting string. For example, to produce the report of diagram 1a, you could write:-

```
FS$="01-40,07-40,11-40,12-40,13-50,"
GOSUB 40000
```

You will have created your own sub-language which tells the report routine to print items 1,7,11,12 and 13 with the figures starting in column 40 or 50. In this case the language assumes preset field lengths for titles and figures.

To parse the format string requires the same technique as used for the month abbreviations. A full print routine for dealing with arrays DA\$ and DA is shown in LISTING 1.

Let's look at this routine in detail.

Line 40010 is a useful technique, provided you have a machine (such as the Commodore PET) which lets you use the same routine to print to the screen or a printer. If DV=3, (PET SCREEN device number), the output will go to the screen. DV=4 will send it to the printer provided you have set it up as device four.

Line 40020 is a loop to scan the formatting string. The INT business is to ensure that all portions of the string are processed. See Mike's Muses this month for more information.

Line 40030 extracts the 'lth' portion of the formatting string. I include commas in my

# PART 2

# NEW STRINGS

Programming  
Technique

strings to make them more readable during program development, but it isn't part of the formatting information. Line 40030 therefore extracts only 5 characters, ignoring the separating commas.

Line 40040 extracts the required solution and formatting parameters from the portion. The array element to be printed is specified in the first two characters and the start column for the figure field in the last two characters. Once again I include the hyphen merely for readability and the parse routine ignores it.

Line 40050 prints the title for the specified figure, padded out to 39 characters with the spaces contained in SP\$, (Set up in my preliminaries block of course) and further padding to ensure that the figure field starts in the right place. For example, if PC is 40, then no extra spaces are printed so the figure field will start straight from the title, i.e. in column 40; whereas if PC=50 then ten extra spaces will be printed and the figure field will start in column 50.

Line 40060 processes the specified figure, DA(EL), to align the decimal point. Subroutine 50400 is one of my standard subroutines, shown in LISTING 2.

Line 40070 handles the next portion of the format string and line 40080 effects a return from the Print Report subroutine.

Subroutine 50400 is a good example of nesting string functions within each other. Line 50410 rounds the figure to two places of decimals. Line 50420 deals with the case of the figure being zero.

## Decimal alignment

The main alignment is carried out in line 50430. To understand it we must examine it from the inside and work outwards. 'Z+.005\*SGN(Z)' ensures that a 5 is added in the third decimal place whether the number is positive or negative. The extra digit is added to ensure that trailing zeros in the first or second decimal place are included. For example, STR\$(1.50) would result in "1.5" but adding the extra digit ensures that STR\$(1.505) gives "1.505" and we can chop off the third digit later on to give "1.50".

RIGHT\$(" " + ..... ,10) right aligns the string, including the third decimal digit, in a 10 wide field.

LEFT\$(.....,9) chops off the third decimal digit.

You can devise your own conventions and meanings for format strings provided you also write the appropriate parsing routine as in the above example. You need not restrict yourself to formatting applications. For example you could use a sequencing string to determine in which order a set of subroutines is to be processed. For example:-

```
2010 SQ$="1542" : GOSUB 40100
40100 REM SEQUENCER
40110 FOR I = 1 TO LEN(SQ$) :
      SG=VAL(MID$(SQ$,I,1))
40120 ON SQ GOSUB 45100, 45200, 45300,
45400, 45500, 45600, 45700
40130 NEXT I : RETURN
```

will cause subroutines 45100, 45500, 45400, and 45200 to be obeyed in that sequence, while on another occasion in the same program you might have:-

```
3010 SQ$="4612" : GOSUB 40100
```

which will cause routines 45400, 45600, 45100 and 45200 to be obeyed.

## Passing parameters

Very often a subroutine needs several parameters. Suppose for example you have a routine to print a message somewhere on the screen. You might want to specify the line and the column within the line at which the message is to start or whether it is to be centred on the line, and whether it is to be in normal or "reversed" display mode. Normally you might write code along the following line:-

```
Z$="WOW!" : LN=5 : CO=14 : DM=0 :
GOSUB 20000
```

meaning "Print 'WOW!' on line 5, starting in column 14 and display in normal mode". Whereas:-

```
Z$="WOW!" : LN=5 : CO=0 : DM=1 :
GOSUB 20000
```

might mean "Print 'WOW!' centred in line 5 in reverse display mode".

Another way of doing this is to use a parameter string and a technique similar to that shown above using formatting strings. In this case, however, the parameters are not in a fixed format or of a fixed length. Instead they are separated in the parameter string by, say, commas. An unpacking routine places the various parameters into a parameter array from which they are extracted by the subroutine which requires them. Such an unpacking routine is shown in LISTING 3.

Line 50510 initialises a collection string, (Z\$), and a parameter array pointer (EL), then scans each character of the parameter string in turn.

Line 50530 checks to see if it's a comma, (the parameter item separator). If not, it adds the character to the collection string and moves on to the next character.

Line 50540 deals with a comma. The contents of the collection string are copied to the element of the parameter array currently pointed at by EL. The collection string is re-initialised and the array pointer moved on one.

Line 50550 moves on to the next character in the string gets copied to the parameter array.

In use you might code along the following lines:-

```
3050 Z$="WOW!" : PS$="5,14,0" : GOSUB
20000
20000 REM PRINT MESSAGE
20010 GOSUB 50500 : REM UNPACK
PARAMETERS
20030 etc.
```

My own PRINT MESSAGE routine uses letters as well as numbers:-

```
4010 Z$="TEST MESSAGE" : PS$="25,C,R"
: GOSUB 20000
```

would cause "TEST MESSAGE" to be printed in reverse display mode in the centre of line 25 at the bottom of the screen.

## Calling subroutines by name

If you've found some of the foregoing a little

heavy, don't panic! They are a distillation of many hours of programming and experimentation. It may well take you an hour or so to see exactly how they work.

To finish up with, let's tackle an apparently very sophisticated problem with a very simple bit of string coding. You will undoubtedly have met the problem where you code something like:-

```
IF A=B THEN..... : REM SORT ROUTINE
```

where you can't put in the line number because you haven't yet written the SORT routine. There have been a number of very clever machine code routines written which either add extra parsing on to the front of the BASIC INTERPRETER whenever it meets a GOSUB, so as to allow such things as 'GOSUB SORT' : or which process the parameter immediately following a SYS call to achieve the same result, e.g. SYS 826 SORT. Both methods then scan the program lines looking for REM SORT or some-such and effect a GOSUB to that line.

You can achieve the same effect with very simple programming in BASIC, by setting up a SWITCHING routine along the following lines:-

```
40300 REM SWITCHING ROUTINE
40310 IF Z$="SORT" THEN 50800
40320 IF Z$="PRINT" THEN 20000
40330 IF Z$="EVALUATE" THEN 25000
40340 etc etc
```

The line numbers after the 'THEN's can be filled in when the appropriate routines are written.

In the main body of your program, you can write:-

```
Z$="SORT" : GOSUB 40300
or
Z$="EVALUATE" : GOSUB 40300
```

without any thought as to what line numbers the SORT or EVALUATE routines occupy. Moreover, if later you decide to alter the positions of these subroutines, you don't have to wade through your program looking for GOSUBs to amend, (SHUT UP!! you smug BASIC AID or TOOLKIT owners!!). Only the line number in your switching routine (in this case 40300) have to be changed and they are all in the one place.

So that's it - my 'mind dump' on the Wonderful World of Strings. Most of the ideas stemmed from looking at other peoples' programs and as always, I advise you to follow through as many programs as you have time for, provided you know what they achieve. I look forward to hearing from you about your own favourite string routines.

# DISK DO

PET supremo **Jim Butterfield** discloses two of his favourite and most useful disk routines. One for checking on the veracity of a particular disk and the other for changing your drive number without recourse to a soldering iron!

## Disk Checkout

Before I take a diskette "on the road", there are two things that I often want assurance about. First, are all the files good? Secondly, are the empty blocks in good condition?

This program tests the disk for these two properties, and adds a third: it will reclaim a scratched file if desired, if the file is still intact on disk.

The program is constructed to work on 2040, 4040 and 8050 disks. On 2040's, however, it can only usefully perform the first of the three activities. Although not fully checked out, it also works on the single drive 2031 unit. In this case, reply S (for Single disk) when asked DRIVE NUMBER?

## Checking Files

There's more to checking a file than seeing if it is there. Some of the questions that need to be asked are:

- Are all the blocks of the file OK?
- Are all blocks allocated?
- Is there conflict with any other file?
- Is the block count correct?

This program checks all of the above. In doing so, it has turned up a minor bug in the disk system: files joined with CONCAT and APPEND are likely to have the wrong block count. This doesn't hurt anything, but gives you misinformation on your directory listing.

File names are shown on the screen as the files are checked. If trouble occurs, the program will continue to the next file. See the note below on errors.

## Checking blocks

If you plan to write on a disk, and aren't sure everything is in good order, option 2, checking blocks, is convenient.

The program reads all blocks and ensures that they are in sound working order. 2040 type disks (DOS 1) can't be checked in this way; when a 2040 diskette is new-ed, all blocks are not written. This program checks by reading, not by writing; it can't do a valid job if some blocks have never been written.

The blocks and sectors are shown on the screen as they are checked. If there is an error, the program will stop with an error notice. See the note below on errors.

## Un-scratching

The program searches the directory for the names of scratched files and asks you whether you want to recover any file. When you say YES, you will be asked to identify the file type - this information was lost when the file was scratched. Then, a number of checks are very carefully made:

- Are all blocks good?
- Are all blocks free?
- Is the block count correct?

If the file passes all the above tests, the unscratching takes place, and the disk is asked to perform a VERIFY/VALIDATE/COLLECT which re-allocates the blocks.

Only one file can be reclaimed during a run. Multiple runs can unscratch many files, one at a time. I did it this way to provide an extra level of protection, but you may change the program to allow multiple un-scratches if you wish.

## The program

The program is written entirely in BASIC, so a user can modify it to his particular needs. Except for a very small part of un-scratch, the program does not write to the disk; it only reads. Be aware, however, that closing a direct channel will force a BAM write to take place; this makes it desirable for a program to run through to completion rather than be stopped halfway through. See the error note below.

The Block Availability Map (BAM) is printed, and this may be an interesting thing to view for users who are not aware of the disk's organisation. The centre track (track 18 or 39) is reserved for the directory, and file space is allocated close to this centre track where possible; this minimises drive head movement. When a file is written on a track, it is not written to consecutive sectors but "hops around" in order to optimise speed.

The program decides what sort of disk it has, based on information supplied by the diskette itself. Thus, a 2040 diskette placed into a 4040 drive will be recognised as being 2040 format.

The directory is read from disk the "hard" way - as a bit

These utilities will work on all Commodore disk units including the new 2031 single drive.

# CTOR

map. This allows us to see things that a "normal" directory won't tell us, allowing us to find file starting locations and to see scratched files if we wish.

This program won't attempt to read a disk which is bad format. If you can't initialise a disk, this won't help you.

## Error procedures

If you find a problem on a disk, get it out of your inventory as quickly as possible. Copy the files you can salvage over to a fresh diskette. Diskette problems don't solve themselves: once a disk is in trouble, the errors can propagate and eventually harm your good files. It won't happen often; but none of us need to have it happen even once.

## Summary

I find the program handy. I hope you will too. The most important factor is that now I can use one program for all disk units.

## DISK CHECK Listing.

Spaces have been added to the listing to aid legibility; it may be necessary to close them up to fit some of the longer lines. The number of spaces between quotation marks in lines 840 and 1070 is not critical - 20 spaces is sufficient. ▶

We repair PET and APPLE computer systems. For first class service call our maintenance office on 250-1481.

**The Dr. Watson Book of Assembly Language Programming**

This is a new teach-yourself guide to machine language programming for 2-3-4-8000 PETS. **Price £10.00**

**AD100**

4-channel A/D Converter. A single board converter with on-board power supply. Works on any PET or computer with a parallel port. Now you can let your computer touch, see, feel, and sense what is around it. Comes complete with instruction manual. **Price £55.00**

**AD-50**

1-channel single board AD/DA converter. Designed to work on any computer with a parallel port. 50,000 samples/sec. Requires power supply. Comes as kit. No software included. **Price £27.50**

**PET TV Interface**

This well-built unit connects to either your domestic TV or monitor. Nothing to adjust. Connects to the PET user port and a second cassette port. For 40 and 80 column PETS. **Price £35.00**

**RL100**

This is a six-channel relay switching unit with on-board power supply. Relay rating is 1A at 30V DC/100V AC. **Price £50.00**

We also build higher ratings and solid state switches. Phone or send s.a.e. for details.

**VC100**

This is a random access video controller. VC100 enables your computer to keep an index of the recordings you have on your video recorder. You can then under software control, rewind, fast forward to any position on your video tape. Send s.a.e. for details.

**CB-2 Soundbox**

Ideal sound box for your PET. Comes complete with programming instructions and demo tape. Plugs into PET user port and cassette port. **Price £17.50**

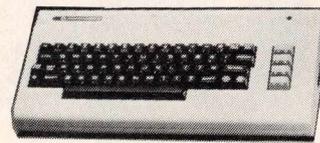

**PEDRO COMPUTER SERVICES**

We also supply a selection of VIC computer games and hardware. Please send s.a.e. for details.

Carr. £1.50 P&P per item. Dealer enquiries welcome.

4 Cowcross Street,  
London E.C.1.

**VIC 20**  
**THE HOME COMPUTER**  
by commodore

For less than £200.00 you can enter the fascinating world of home computing. Whether you want to relax with a game of space invaders in full colour and sound or you have a practical application in mind, e.g. information storage and retrieval, the VIC 20 is for you. Your domestic colour or black and white T.V. is used to display text and graphics and the full-size typewriter keyboard allows you to write your own programs following the step by step manual.

**VIC 20 GROWS WITH YOUR NEEDS:**

- \* extra capacity – up to 29K of added memory
  - \* rapid data retrieval – single disk drive
  - \* printer – low cost dot-matrix printer
  - \* control – IEEE 488 interface (allows VIC 20 to use PET/CBM equipment)
- commodore VIC 20 – no other computer gives you so much for so little.

FULL RANGE OF COMMODORE COMPUTERS IN STOCK. ADVICE FREELY GIVEN.

Ring now for full details: 061-834 4233

# DISK DOCTOR

## ◀ Device Changer

CHANGE DISK changes the device number of any disk: 2040, 4040, 8050 or 2031. It is an adaptation of a Commodore utility program.

Why would you want to change a device number logically? You can dig into the innards and restrap the disk to a new device number if you wish. "Logical" changes are temporary and vanish when power is removed from the unit.

## Disk copies

The most usual reason is a temporary hookup. In order to make copies or do some similar job, you want to hook together two or more units. Maybe you've borrowed an 8050 from a friend for the afternoon; he wouldn't be pleased to find the unit restrapped when you return it.

The trick is to arrange for the program to search out the right place to do the disk unit change. There are three different sets of locations which are used on various disks: 12/13 on the early 2040 and 3040 units; 119/120 on 2031 units; and 50/51 on 4040s and 8050s. We find out which one is correct by PEEKing the innards of the disk and seeing which set of locations contain the correct (old) numbers. When we find the right one, we make the change.

For those users interested in "innards": the disk units check the device strapping once only at power up. It stores the computed "listen" and "talk" addresses in RAM memory, and from then on will use only the computed values. So we can change RAM, and the new device number will be operational until we cut the power.

## Listing: CHANGE DISK program.

Spaces have been added to the listing for legibility; you may need to close them up as you enter the program.

# COMMAND-O ON TRIAL!

If you own a PET or CBM computer with disks then you ought to have a COMMAND-O chip. It's got all the facilities of that other chip (can't think of the name), plus BEEP, EXECUTE, INITIALIZE, PRINT USING, AUTO-REPEAT - and you can scroll a program listing up and down the screen! There are lots more functions, but perhaps the best way to learn about COMMAND-O is to use one. If you order a COMMAND-O chip from SUPERSOFT before 31st March you'll qualify for our special money back offer. Just return it in good condition within 10 days and we'll refund your money in full! COMMAND-O is for Basic 4 users only and costs £59.95 plus VAT. It fits in the UD3 or UD12 socket and comes with a comprehensive, but readable manual.

ARROW is a chip that will be of particular interest for committed tape users - because it will LOAD, SAVE and VERIFY at 7 to 8 times normal speed! There are lots more features for just £30 plus VAT, but since we're making the same money back offer why not try it out. Don't forget to tell us which machine you own (it works on all models except the original Old Roms) and which socket is available.

# FREE TO PET OWNERS...

Our 1982 catalogue is now available, and it's absolutely free to PET owners (just tell us what equipment you've got and we'll add you to our computerised mailing list!)

# SUPERSOFT

First Floor, 10-14 Canning Road, Wealdstone,  
Harrow, Middlesex, HA3 7SJ, England  
Telephone: 01-861 1166

# the vic centre

Adda Computers Ltd., a major supplier of computer systems to industry and business, have opened the Vic Centre in West London. Here you can see, discuss and buy everything to do with the new VIC 20 personal computer—in person or by mail. Hardware, software, technical advice and information is available from an experienced staff of experts. Even if you already own a VIC 20, get on our mailing list to know about new developments. Remember—everything has the backing of Adda's reputation, and there's a full 12-month warranty on all hardware. The Vic Centre is easy to reach—Just off the A40, close to North Acton tube station.

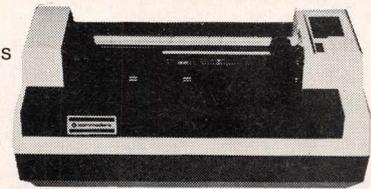

## Not just a computer but a whole expandable system

**AT ONLY £189.95 inc. VAT. Special cassette deck £44.95 inc. VAT.**

The VIC 20 is a fully-fledged, easy-to-use computer. It's the core of a great expandable system, with full-size keyboard operation. First-time users can work it immediately with plug-in program cartridges, using your own colour TV to get up to 24 colours on screen, and three different sound tones. Or write your own programs in BASIC. The VIC 20 lets you build a system as needs and budget dictate. You can expand its memory to 32k Byte with Plug-in modules, and transfer data to external storage units. So the VIC 20 is more than just a personal computer—and its system will expand to put it even further ahead.

### VIC 20 Dot Matrix Printer

Tractor-feed, 80 character-per-line, 30 characters-per-second printer. **£229.95 incl VAT.**

### VIC-RS232 INTERFACE

Fully implemented (true levels) RS232C-V24

### BI-DIRECTIONAL INTERFACE

Allows Vic to work as Mainframe Terminal Drive a Qume Daisywheel or a Paper Tape Punch etc. etc.

**FEATURE** This unit contains master power supply which supports Vic's own supply when carrying Memory Expansions, Cassette Drives, Light Pens, Printers etc.

### VIC-MEMORY 3K

Small size—low cost memory expansion. Plugs into Vic and reproduces memory-port. Can be used with other expansions gives a total of 6k user static ramon Vic.

**FEATURE** This board allows Vic to move Basic to begin at 1024 (\$0400) as in Pet, and enables the use of HIGH RESOLUTION COLOUR GRAPHICS **£40.25 incl VAT.**

### VIC-TOOL KIT

**£28.75 incl VAT.**

For those who know tool kit on Pet we now have same facilities for Vic. Renumber, Auto, Append etc. This may be used with the stack VIC Rom Switch Board.

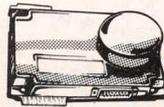

### VIC ROM SWITCH BOARD £40.25 incl VAT.

An inexpensive unit which plugs direct on to Memory Expansion Port of the VIC and allows the insertion of up to 4 ROMS for games packs or toolkit aids, etc.

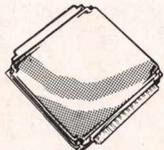

**FEATURE.** Simple software switch exchanges each pair of ROMS into VIC's ROM space allowing 'clashing' ROMS to be used.

**FEATURE.** Plug-in zero force sockets are available as optional extras to help eliminate pin damage to valuable ROMS.

**TERMS AND CONDITIONS:** All goods sold subject to Adda terms and conditions of sale. Full details available on request, but include: 7 day money back guarantee, Adda 12 month hardware warranty. Please allow 21 days for delivery. Allow 7 days for personal cheques to be cleared. Quoted prices are inclusive of VAT.

£56.35 incl VAT.

### VIC-LIGHT PEN

This high quality light pen works in both normal and Hi-Res modes on the Vic allowing simple interaction with the Vic without keyboard entry.

Easy to program and easy to use. e.g. Menu selection. Non-keyboard entry. Teaching Games.

**FEATURE** touch sensitive "Enter" contacts to eliminate accidental entry.

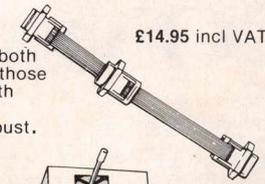

£28.75 incl VAT.

### VIC-Games Port Adaptor Cable

A two into one adaptor for use with both joysticks and light pens. A must for those who require full control of games with graphics.

**FEATURE** low-cost High quality. Robust.

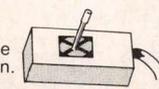

£14.95 incl VAT.

### VIC JOYSTICK

Single

Hand-Held joystick units for games use available in Pair or Single configuration. N.B. (2 Singles will not work as a pair unless modified)

£14.95 incl VAT.

### Le Stick £30.75 incl VAT.

The ultimate joystick. One handed multi-directional super sensitive stick with built in fire button.

### VIC software Each of these tapes £14.95 incl VAT.

#### Codebreaker/Codemaker

You play the VIC or the VIC plays you in this computerised version of Mastermind.

#### VIC Seawolf, VIC Trap and Bounce-out

3 fun games, a submarine shoot out, a beat the VIC and an old favourite pub game. Good games with different skill levels.

#### Monster Maze and Maths Hurdler

A fun game with good colour and sound and a mental arithmetic learning game. Highly rated by everyone we have shown it to. Harder than you think.

# The Compleat Computer

## ★ CRIB SHEET ★

FOR  
BEGINNERS

Read this and instantly understand every article in this issue.  
Dazzle others with your deep knowledge of computing.

Also guaranteed to prevent beach bullies kicking sand in your face.

There is a great definition of the difference between **Hardware** and **Software**: if you can kick it then it's Hardware! Hardware is the electronics and the casing in which they are mounted. Software is the **programs** you run on the computer. It's like a Hi-Fi system - the amplifier, record deck and speakers are all hardware, while the music you play on it is software.

The hardware of a microcomputer will consist of several parts including a **keyboard** for typing in instructions and a Visual Display Unit or **VDU** for displaying results. This could be your own T.V. set, or a specially modified screen built into the computer. On it you will be able to display **alphanumeric** characters (A-Z, 0-9 and punctuation) and special **graphics** characters for diagrams and drawings. These characters range from simple lines and squares, to intricate games symbols. The higher the **resolution** of your graphics, the finer the lines that can be drawn, and the smoother the curves appear.

Inside, the computer consists of **Integrated Circuits** (I.C.s) or 'chips' - small, solid-state electronic devices, encased in black plastic. The most important of these is the Central Processing Unit or **CPU**, which performs all the calculations and manages the whole system by shuffling information around its parts. The two most common 'models' of CPU are the MOS Technology **6502**, used in Commodore, Apple, Acorn and Atari microcomputers, and the Zilog **Z-80** used by Tandy and Sinclair amongst others. Two other popular CPUs are the Motorola **6800** and Intel **8080**.

The computer has two types of memory. Random Access Memory or **RAM** is temporary memory - anything stored in it is lost when you switch the computer off - the technical term is **volatile**. RAM is used to store all the **commands** (instructions to the computer) you type in, the program which it is currently running and all the **data** to which that program refers. This data consists of **variables**; a variable is just one item of information and has a name which identifies it e.g. PRICE and a value - 5, perhaps. **Integer** variables can only cope with whole numbers, **Floating Point** variables can cope with decimals as well. **String** variables are not numbers, but strings of characters (such as someone's name or address) which can be **sorted** into alphabetical order, or **searched** for references to a particular word or 'phrase'.

**ROM** (Read Only Memory) is permanent memory - you can't alter it, and switching off won't erase it. ROM is used to store the special programs that tell the microcomputer how to behave.

These include the **Operating System** which enables the CPU to manage the keyboard screen and memory all at once. Operating Systems vary greatly from machine to machine though there are a few standard ones including **CP/M** and **Unix**. The advantage is that applications programs written on one computer using one particular operating system should be compatible with any other running the same operating system, regardless of its individual design.

There are other types of memory, such as **PROM**, **EPROM**, **EEPROM** and even **EAROM**, each with their own redeeming features, but these are generally only used in specialist devices, or for development purposes prior to full-scale production.

All forms of memory are measured in the same units. A **Bit** - short for Binary Digit - is the basic unit of computer memory, and can only be used to store a '0' or '1' - equivalent to being switched off or on. These are compounded into larger units to store useful information. Eight Bits form a **Byte** and most CPU's process one byte at a time. A byte is usually the equivalent of a single digit or character, but can represent something more abstract.

Some of the newer and more advanced CPU's, like the 68000 and Z8000, process 16 Bits at a time, a considerable increase in speed. A typical process might be carried out in approximately a millionth of a second!

Exactly 1024 Bytes makes one kilobyte or **KByte** - so that a 32K computer in fact has 32x1024 or 32768 bytes of memory. The reason for that strange number is that it can conveniently be expressed in **Binary**, which is the numbering system used by computers.

The CPU is only capable of very crude operations - such as adding two digits - but can execute them at very high speed. To make it perform any real function, the CPU needs to be given a long list of instructions - a program - written in a form it can understand; this is called **Machine Code**. Unfortunately it is almost incomprehensible to humans, consisting of rows of digits, the result being very slow programming and many errors!

Various **high-level languages** for computers have therefore been developed, which are rather closer to English, and hence easier to program in. **FORTRAN** is a language suited to Engineering calculations, whilst many business programs are written in **COBOL**. By far the most common language, and incidentally the easiest to learn, is **BASIC**; fortunately it is fairly compatible from machine to machine. The most standard is called **Microsoft BASIC** and is found on PET, Apple and many others. Of increasing popularity is **PASCAL**, which is harder to learn, but better for writing large programs, and inducing good 'program discipline' in new programmers.

Programs written in a high-level language have to be converted to Machine Code before they can be run by the CPU. There are two types of special program that carry out this translation. The first is the **Compiler** which translates your whole program into Machine Code before executing it. An **Interpreter** works through your program line by line, translating and executing as it goes. Typically an Interpreted program will run 10 times slower than a compiled one, but will use up less memory because only one version is stored. Interpreters are more useful if you are developing a program, since the discovery of an error - a **Bug** in computer jargon - does not necessitate recompiling the entire program. The precise difference between Interpreting and Compiling takes rather more explanation. Those interested should read our article "Compiling For Speed" in the July issue.

If a computer is designed to handle a number of different programming languages, the various Interpreters and Compilers will be stored in RAM. Machines which only run BASIC, however, generally have an interpreter in ROM. This kind of software, permanently embedded in Hardware, is sometimes called **Firmware!**

And so back to hardware. The I.C.s are held in place on a Printed Circuit Board, or **PCB**, which is a stiff card with many fine copper tracks that interconnect the components. Indeed some cheap computers, called **Single-Board** computers, *only* consist of a PCB. You need to be a dab hand at soldering to assemble the components into a working computer.

Protruding from the extremities of the PCB are the **Interfaces** which allow the computer to exchange information with other electronic devices. This exchange is known as **Input/Output** or I/O. An interface will consist of several lines or wires - called a **bus** - to handle the data and sundry control signals needed to synchronize the timing of the various operations. The sequence of events involved in exchanging a piece of data is called the **protocol** - a term doubtless derived from the ritual dance of diplomacy. This terminological jest is carried a stage further with one particular sequence of events in an interface being known as a **handshake**; this signifies that the transaction is complete!

There are several common interfaces as well as a number of obscure and non-standard ones. Unless you buy a special conversion box, you can only connect together devices having the same interface. **IEEE 488**, **RS232** and **S-100** are some of the most widely accepted standards. The first of these is a **parallel** bus, meaning that 8-bits are transmitted simultaneously down 8 lines. The second is a **serial** interface, so called because the bits are transmitted one after the other down a single line; this is more economical for transmission over long distances. S-100 has one hundred lines but is only used for connecting together PCBs inside one box. The number of bits sent per second is called the **Baud Rate**.

These interfaces are most frequently used by a microcomputer for communicating with its **peripheral** devices. They are also used when communicating with other computers, which is termed **Networking**.

The most common peripherals are listed below. A **Cassette** unit **Saves** programs and data from computer memory on cassette, so that they can be **Loaded** back again when required. A **Disk Drive** does the same, employing a circular piece of magnetic material called a **Floppy Diskette**. This has a higher storage capacity than cassette and allows faster access. See "Do You Need 'Disk'?" in this issue.

A **Printer** is used to create permanent copies of information on paper, and will usually offer either high speed or high print quality. The differences are explained in "How to buy a Printer" (August issue). Finally, a **Modem** is a small unit that converts electronic data into audio tones and back so that information can be sent over an ordinary telephone line.

No other computer system in the world at any price - can offer you more facilities than...

# SILICON OFFICE

---

A British world beater.

A complete Electronic Office System in one program to run on the new Commodore large memory computer. It will happily cope with just about every business and commercial application. Accounts, word-processing, payroll, statistical analysis, stock control, mailing lists - SILICON OFFICE does it all.

No other computer system in the world - at any price - can offer you more facilities than SILICON OFFICE.

See it at your local Commodore dealer or send for further details.

## Computer Folklore – The old old story!

Some of you will have heard this tale, but bear with me while I re-tell it for the multitude of new computer enthusiasts who have sprung up in the last two or three years.

Long, long ago, when computers were called electronic brains: when you could walk about inside them and toast muffins on the glowing valves, a certain Regional Electricity board installed one of these wonder machines to automate the billing of its consumers. The software not only calculated the amount due and printed the invoice and address but also checked for evidence of payment and if necessary, sent out the red reminder slips and the dreaded "Unless within 7 days...we will cut your supply and take legal action" letter.

One day a certain doughty traveller who spent much of his time in foreign climes returned to his home after a three month absence to find a bill for the electricity consumed. Now because he had been away so long, he had in fact consumed no electricity at all, and was pleased and amazed to see that the wonder electronic brain had worked out this fact and submitted a bill for £0.00s.00d. (Yes, it really was that long ago, before the coming of our modern monopoly money). "What a clever machine!", he exclaimed as he crumpled the bill into a ball and flung it into the wastepaper basket.

Back at the Regional Board's head office, the computer waited the stipulated number of weeks for our hero to pay his bill, and then sent out the red printed reminder for £0.00s.00d. The programmers had forgotten to tell it that zero amounts due could be ignored. With a puzzled laugh, our traveller flung the reminder into the bin.

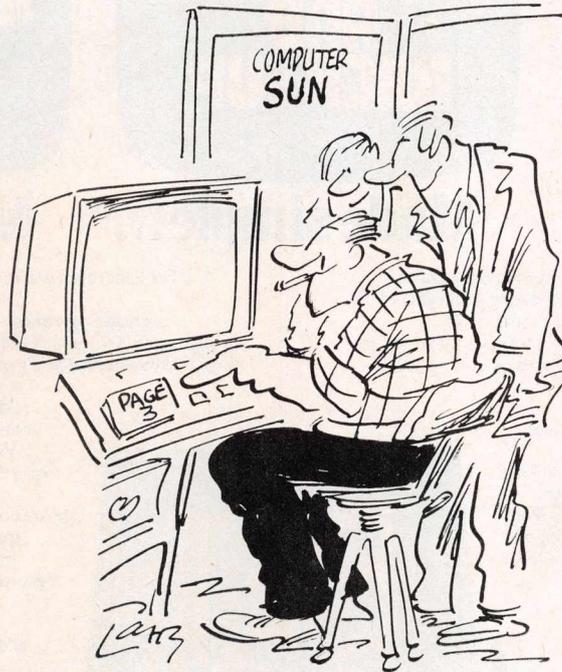

Again the computer waited the specific time and then sent out the "We'll cut off your...." letter. Trembling with rage and possibly fright, the consumer rang the board. After many hours of backtracking and cries of incredulity that such a thing could happen, and then further hours of brain bashing working out how to put matters right, the board rang him back. "It's a fault in our computer program", they said. "The quickest way of getting it to stop pestering you would be for you to send us a cheque for £0.00s.00d: we'll punch in the details of the cheque number and bank account together with the invoice number. That should hold things together until our programmers do a bug correction run in a few weeks time."

So our hero sent them a cheque for £0.00s.00d, and duly received a receipt from the now satisfied electronic marvel. And that could have been the end of the story .....

.....except that our hero's bank also had a computer! And the programmers had not foreseen the need to process a cheque for £0.00s.00d! So it was rejected and returned by the bank's computer to the computer of the Electricity Board. "A returned cheque", thought the Board's computer. "It must have bounced." Without further ado it sent a sternly worded letter to our hero, informing him that his cheque for £0.00s.00d had bounced and what was he going to do about it?

More deliberation followed and the Board called in outside consultants to assist in solving the problem. This they duly did, and instructed our consumer, who slowly made his way to the nearest Board showroom, alternately banging his head against every street light and rolling about

on the pavement in hysterical laughter. "I've been instructed by your head office to come here to pay my electricity bill", he spluttered handing over the latest request for £0.00s.00d. "They told me to pay cash!!"

## Stranger than fiction

I'm pretty sure that the above tale has had many embellishments added and now contains as much fiction as fact, but certainly a zero bill was printed and sent out. You'd think that by now we would have learnt the lesson, but recently a little bird told me of a similar error in a very modern and complex computer network. Two computers in the network, so I am told, had worked out a particular figure but the two results disagreed about the umpteenth decimal

place. In other words the two results were for practical purposes the same but nevertheless an error was reported by the network. The result, as you may have seen on television or in the press, was the postponement of the Space Shuttle launch due to 'software incompatibility in the computer system.'

## Cast out the beam in thine own eye!

And after we've had a good guffaw, and felt terribly superior, we'd better check over our own programs. The chances are the same error exists (latently perhaps) in over 60% of any serious programs you've written. Consider the following statement in BASIC.

```
IF A=B THEN ....
```

Seems innocent enough doesn't it? But try entering LISTING 1 into your machine and running it. You would expect it to print "EQUAL", but instead (at least on most micros) it prints "NOT EQUAL"! Why? ►

# CHOOSING A COMPUTER MADE SIMPLE

**FOR  
BUSINESS**

**Made simple...**

**FOR WORD  
PROCESSING**

**Made simple...**

**FOR  
EDUCATION**

**Made simple...**

**ADVICE**

**Made simple...**

**SERVICE  
AND  
BACK-UP**

**Made simple...**

**IMPROVING  
ON PET**

**Not so simple**

**Choosing a computer is...** Choosing a computer is more than just choosing a computer. That is, it's a lot more than just hardware. Mind you, PET stacks up very well when it comes to the computer itself. Because at Commodore we've been involved with microcomputers for over 20 years - in fact, many other manufacturers pay us the compliment of using our microchip for their own computers.

So, when you choose PET you know you have a microcomputer that everyone in the business admires and respects.

... **choosing software** ... Our software programs live up to the quality of our computer. The range, from both Commodore and specialist suppliers, covers everything from word processing, stock control and payroll to accounting and information processing. As well as specialist applications for education and the sciences.

For light relief, we've a pretty impressive range of games and other brain-teasing packages.

... **choosing value** ... Our computers start at under £200 and go through to £8000 - which will buy you a business system. The extent of our range makes sure that you'll easily be able to choose the right computer for your individual needs.

... **choosing a dealer** ... As you can see, you do get nationwide dealer back-up with Commodore.

What's more, many of our dealers have specific expertise - which means they can advise on anything from business systems to specialist technical applications. So, if your particular problem is of a highly specialised nature, it may be best to contact our Information Department direct. They will then recommend the dealers who understand - and who speak your kind of language.

... **choosing your computer** ... It all adds up. By choosing a PET you can find out how you can benefit from our experience.

Send to: Commodore Information Services, P.O. Box 109, Baker Street, High Wycombe.  
Tel: Slough 79292

I'd like to know how Commodore could make choosing a computer simple for me.

◀ Most micros work in floating point binary to approximately five bytes of accuracy and translate their results to decimal with a maximum accuracy of 9 or 10 digits. Two results can be printed which translate to the same rounded decimal value, although the binary versions are in fact different.

A straightforward way of avoiding what from now on I shall call "The Shuttle Bug" is to consider the degree of accuracy required, subtract one quantity from the other and check that the result is less than the accuracy level specified. Listing 2 shows the kind of thing required.

```
10 A=1/25 : B=.04
20 PRINT A, B
30 IF A=B THEN PRINT "EQUAL" : END
40 PRINT "NOT EQUAL"
```

### Listing 1

```
10 A=1/25 : B=.04
20 PRINT A, B
30 IF ABS(A-B)<1E6 THEN PRINT "EQUAL" : END
40 PRINT "NOT EQUAL"
```

### Listing 2

## Prize Problem – Tight Fit?

A cupboard has dimensions XC, YC and ZC. Three packages have dimensions X1, Y1, Z1, X2, Y2, Z2 and X3, Y3, Z3. Write a program which checks to see if the packages, lying flat on one side or another, can be fitted into the cupboard.

Assume the cupboard and packages are 'box-like', (Rectilinear parallelepipeds!). Include cupboard dimensions and several sets of package dimensions as data statements. The first program drawn at random on March 15th which processes my test data dimensions correctly will win the *MicroComputer Printout* Silver Space Invader Badge.

## Personalised dates

Keen-eyed readers will have noticed the error that crept into my last column: Mr. A.R. Gould was, of course, the winner of the Roman Numerals competition set in the December issue, with his excellent piece of coding.

The first correct entry to the Personalised Dates competition set in January was that of:-

Mr. L.H. Doy,  
3 Old Mill Lane,  
Forest Town,  
Mansfield,  
Notts, NG19 0EW

Both qualify for the exclusive *MicroComputer Printout* Space Invader lapel badge – made from Sterling Silver.

# ZX81 ATOM VIC

Make the most of your microcomputer with our popular range of proven books:-

- [ ] **GETTING ACQUAINTED WITH YOUR VIC 20**, by Tim Hartnell, with over 60 programs to get your VIC up and running from day one. **£5.95**
- [ ] **GETTING ACQUAINTED WITH YOUR ACORN ATOM**, by Trevor Sharples and Tim Hartnell. 184 pages, 80 programs, including draughts. **£7.95**
- [ ] **GETTING ACQUAINTED WITH YOUR ZX81**, by Tim Hartnell. Eighty plus programs in this 120-page book, including draughts. **£4.95**
- [ ] **MASTERING MACHINE CODE ON YOUR ZX81 OR ZX80**, by Tony Baker. 180 pages, teaches machine code from first principles. **£5.95**
- [ ] **THE GATEWAY GUIDE TO THE ZX81 AND ZX80**, by Mark Charlton. Over 60 programs and routines, ZX BASIC explained in detail. **£5.95**
- [ ] **49 EXPLOSIVE GAMES FOR THE ZX81**, edited by Tim Hartnell. **£5.25**
- [ ] **INTERFACE**, the monthly magazine published by the National ZX80 and ZX81 Users' Club, in conjunction with the Independent Atom Users' Group, is just £9.50 (UK), £12.50 (Europe) for 12 issues. **Sample copy**, with many programs for each machine, book, software and hardware reviews, education, contact addresses, **just £1**.

## VIGIL

Exciting, new games interactive language.  
 \* Easy to learn with 60 powerful commands  
 \* Double density graphics, large number display, sound!  
 \* 9 complete programs including - Breakout, SpaceWar, Anti, U.F.O., Maze  
 \* PET/CBM version for OLD/NEW/4.0 ROMs and 8K of memory  
 \* VIC version has color and enhanced sound (req. 3K memory expander)  
 \* Comprehensive 50 - page manual U.S. & CANADA FOREIGN

PET/CBM

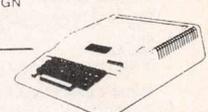

VIGIL for PET/VIC w/9 games on cassette (diskette add \$3.00).....\$35  
 VIGIL User's Manual (refundable with software order).....\$10  
 VIGIL Interpreter Listing (6502 Assembler Language).....\$25

### TINY BASIC COMPILER - PET

A true compiler that turns your BASIC program into fast machine code  
 \* Subset of PET BASIC compiles to 6502 machine code. Req. only 8K memory  
 \* Has full floating point capabilities and functions  
 \* Compiler listing available with 16K version (included)  
 \* Can load compiled machine code anywhere in memory  
 \* On cassette (add \$3.00 for diskette) U.S. & CANADA FOREIGN

TINY Basic Compiler OLD/NEW/4.0 ROMs/8032 with 8K memory.....\$25  
 TINY Basic User's Manual (refundable with software order).....\$5

### PET & APPLE II USERS TINY PASCAL

Structured language alternative to BASIC for PET or APPLE II includes:  
 \* LINE EDITOR - creates, modifies and maintains source language  
 \* COMPILER - converts your source to an executable P-code format  
 \* INTERPRETER - executes compiled P-code. Features built-in TRACE  
 \* CASE-OF, WHILE-DO, IF-THEN-ELSE, REPEAT-UNTIL, FOR-TO-DOWNTO, PROC, FUNC  
 \* Graphics version has more: GRAPHICS, PLOT, POINT, TEXT, INKEY, ABS, SQRT  
 \* APPLE II has lores & hires-COLOR, HGRAPHICS, HCOLOR, HPOINT, PDL and TONE  
 U.S. & CANADA FOREIGN

TINY Pascal PLUS - GRAPHICS PET 32K NEW/4.0 ROMs/8032/diskette.....\$55

 TINY Pascal 6502 Interpreter Listing-GRAPHICS version.....\$25

### PIPER-THE MUSIC MACHINE

Here's the simplest way yet to compose, conduct and play music on your VIC/PET. Complete music capability - play all note values, list and edit your music, easily handles repeats and rests. Written in fast machine language. Includes sample compositions and manual. VIC version does not require additional memory. PET version requires external CB2 speaker.

PIPER of PET/VIC on cassette (add \$3.00 for diskette).....\$25  
 PIPER User's Manual (refundable with software order).....\$5  
 PIPER 6502 Assembly Listing.....\$25

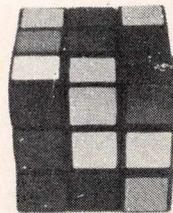

### PET MACHINE LANGUAGE GUIDE

Now in its ninth printing. Learn the hidden talents of your OLD, NEW or 4.0 ROM PET/CBM with this easy to follow manual. Details 30 of the PET's builtin routines.  
 PET MACHINE LANGUAGE GUIDE for OLD, NEW or 4.0 ROMs.....\$9

Orders prepaid in U.S. Dollars, VISA, MC, ACCESS, etc. Prices include postage.

# ZX 81 PET

TRS 80 LEVEL II  
AND VIDEO GENIE

### RUBIK CUBE SOLVER

Rubik's cube completely solved step by step from any starting position.

### RUBIK CUBE SIMULATOR (8K)

Also available for the 8K new Monitor UK101, this easy to use program simulates all the possible movements of the cube. By storing all your moves and even allowing you to run backwards to a previous position, the simulator makes the formulation of your own solution possible.

Rubik Cube Solver plus instruction booklet ..... £4.50  
 Rubik Cube Simulator plus instruction booklet ..... £4.00

### SPECIAL OFFER!

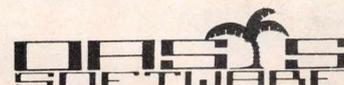

The Solver plus Simulator plus booklet ..... £5.50

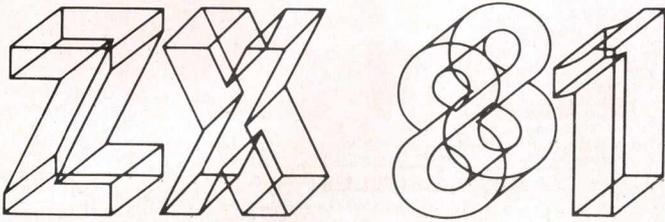

### MANY MORE PROGRAMS AVAILABLE

If you own a ZX81 with 16K, TRS 80 Level II, Video Genie, PET or UK101, send 95p (redeemable against your first order) for full catalogue and free listing (please state machine)

All the above prices include p+p and V.A.T. available from .....

OASIS SOFTWARE  
 LOWER NORTH STREET,  
 CHEDDAR, SOMERSET.

(full stops, then zeros, through the numbers then through the letters). RUN it and you'll see what I mean.

### Feeble Space Invaders

Our final program, SPLATTER, is a very feeble version of SPACE INVADERS designed just to show how POKE can be used to create moving graphics. Of course, the PRINT AT function on the ZX81 would do the task as well, and almost as quickly. In fact, PRINT AT is used to fire at the little invader near the top of the screen. Once you understand how the POKE function works in this program, you might like to rewrite the fire subroutine (starting at line 5000) to use POKE.

The program sets up a shape near the top of the screen, which moves at random. About halfway down is you (an inverse space). The "Z" key moves you left, and the "M" moves you right. When you think you're underneath the invader, you press the "A", and a little plus sign rushes up the screen. If you hit the invader, your score will be incremented, and the time - which is being updated while you are playing (the variable is called TIME, it is set to zero in line 9080 and incremented in line 75) - value is reprinted. You have to hit five invaders in the shortest possible time. Play it over and over again, trying to reduce the time figure, and when you're tired of this, rewrite the fire routine so that it uses POKE.

This then, briefly, covers two important uses of PEEK and POKE, for storing and retrieving information from a REM statement, and for moving things around the screen.

```

10 REM SPLATTER
20 GOSUB 9000
30 LET M=A
50 LET A=A+INT (RND*4-RND*4)
60 IF A<2 THEN LET A=2
70 IF A>30 THEN LET A=30
75 LET TIME=TIME+1
76 POKE 33*B+M+1+PEEK X+256*PE

```

## Old tricks for new Pets...

COMMAND-D is a FOUR KILOBYTE Rom for the 4000/8000 Basic 4 Pets with all the "Toolkit" commands RENUMBER (improved), AUTO, DUMP, DELETE, FIND (improved), HELP, TRACE (improved & includes STEP), and OFF - plus PRINT USING - plus four extra disk commands INITIALIZE, MERGE, EXECUTE, and SEND - plus extra editing commands SCROLL, MOVE, OUT, BEEP, and KILL - plus SET user-definable soft key, 190 characters - plus program scroll up and down - plus 8032 control characters on key. Ask for Model CO-80N for the 8032 or CO-40N for the 4016/4032. £50.00 plus Vat

## New tricks for old Pets...

DISK-O-PRO is a FOUR KILOBYTE Rom that upgrades 2000/3000 Pets, but lets you keep all your old software - including Toolkit. As well as REPEAT KEYS and PRINT USING, you get all the Basic 4 disk commands CONCAT, DOPEN, DCLOSE, RECORD, HEADER, COLLECT, BACKUP, COPY, APPEND, DSAVE, DLOAD, CATALOG, RENAME, SCRATCH and DIRECTORY - plus extra disk commands INITIALIZE, MERGE, EXECUTE and SEND - plus extra editing commands SCROLL, MOVE, OUT, BEEP and KILL - plus SET user definable soft-key, 80 characters - plus program scroll-up and scroll-down. We recommend the 4040 disk or upgraded 3040 for full benefit of disk commands. Ask for Model DDP-16N for new Pets 2001-3032, and 2001-8 with retrofit Roms & TK160P Toolkit. £50.00 plus Vat, other models available.

PRONTO-PET hard/soft reset switch for the 3000/4000 Pets. We don't think you'll "crash" your Pet using our software, but if you do the Pronto-Pet will get you out! Also clears the Pet for the next job, without that nasty off/on power surge. £9.99 + Vat

## and no tricks missed!

KRAM Keyed Random Access Method. Kid your Pet it's an IBM VSAM disk handling for 3032/4032/8032 Pets with 3040/4040/8050 disks means you retrieve your data FAST, by NAME - no tracks, sectors or blocks to worry about. Over 2,500 users worldwide have joined the "Klub"! Now you can too, at the 1981 price, £75.00 plus Vat.

SPACEMAKER All our Rom products are compatible with each other, but should you want, say, Wordpro with Kram, or Disk-o-pro with Visicalc, then SPACEMAKER will allow both Roms to address one Rom socket, with just the flip of a switch, for £22.50 plus Vat.

We are sole UK distributors for all these fine products. If your CBM dealer is out of stock, they are available by mail from us, by cheque/Access/Barclaycard (UK post paid) or send for details.

# PROGRAMS THAT

“The end of programming as you know it”. This statement seems to be typical of the publicity surrounding the current influx of program generators – programs which claim to lead the non-technical computer user through the previously complex task of writing software, by means of English question and answer techniques.

Everyone who has been reading the computer press over the last few months will have heard of The Last One, probably the most publicised program ever. There are several other similar products which may have escaped the casual observer – Pearl, Genesis, Nucleus, CORP and Adds Manager are just some of them. Let's start by taking a look at what a program generator is, and why YOU might want to use one.

## Fundamental language

Ever since computers were invented, back in the halcyon days of valves, and rooms the size of the Albert Hall to house them, programmers have been devising ways of simplifying the task of writing software. Initially, it was necessary to code every command in binary (long strings of 1's and 0's), the fundamental computer language. This level of programming is called machine code. In order to assist the programmer, the binary numbers were condensed into either octal or hexadecimal, which cut down the number of characters required to enter an instruction, and also made it far easier to remember the codes.

The next development was an assembler, which allowed the use of mnemonics – usually three or four letter representations of the instruction – together with labels for sub-routines and other, more human features. From the assembler we progressed to the use of “high-level” languages such as COBOL, FORTRAN, BASIC and the like. These languages were developed for specific types of user; FORTRAN for the scientist, COBOL for the businessman, BASIC for teaching programming, and their vocabularies were made as close as possible to English words. Once the erstwhile programmer has written his “source code” in one of these high-level languages, he invokes either a compiler or an interpreter, depending on the machine, the language and the application in hand.

The compiler or interpreter then converts the high-level instructions into a whole sequence of machine code steps, which the computer can then execute. Since there is a limit to the number of different words a language can contain, owing to the size restrictions of the computer's memory, this conversion pro-

cess lends itself to generalities and must be less efficient than programming directly in machine code, step by step.

## Series of menus

A program generator produces code in one of these high-level languages by prompting the user, often by means of a series of menus, for the design of the program he wishes to create. The screen layout, the size and type of the input fields, the shape and content of the printed reports, the calculations to be performed on the data, and so on are all defined by means of these menu screens. Once all the parameters have been set up, the generator will “write” the program in whatever language is being used – in other words, the program replaces the programmer bashing the keyboard, and manufactures the program instructions directly from the parameters it has been given. It does this by selection from a range of standard pieces of program, which it will fit to the requirements of the user.

## BY PETER WOOD

No matter how the user wishes the screen display to appear and what he wants to do with an input, for instance, the same routines can always be used to create the display and to cause an input to be requested at a particular point in the program. This standardisation must inevitably lead to an even less efficient use of the machine than that achieved by normal high-level programming, and the results will often be slower in operation and larger in size than a manually written program, although that is not to say that this always matters.

## How complex?

Another critical point is – how easy are these programs to use? There is little point in using a piece of software to generate code for you, if the ritual you have to go through is as complex as writing the code manually. Certainly menu selections such as “set pointer to the contents of a file field” do not inspire confidence in the first-time user, and cause furrowed brows in many experienced computer

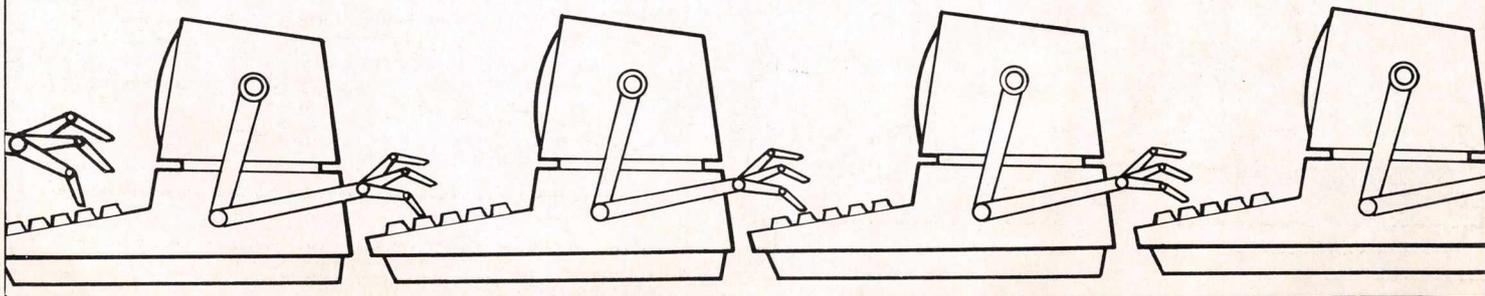

professionals' normally placid features. It is obvious that a program cannot be universal in nature without being as complex as that which it attempts to replace, if not more so.

The answer must be some sort of compromise. The facilities provided by a program generator are always more restrictive than a true high-level language, but the user is not constrained to learn 60 or 70 BASIC statements and the pedantic syntax that connects them. The majority of these programs seem to provide the facility to create screen formats (in the same way that you might lay out a manual record card), report formats (akin to simplified word processing), and calculations to be performed on the data in the record cards. This boils down to a sort of database program written to your own specifications.

## Programmers tools

Whether you can really manufacture all the software necessary to run your business, including, say, ledgers, payroll, stock control and so on, is extremely dubious. Even more to the point, if you have no understanding of the code generated by the program, the only way to make changes to applications is to re-create the program from scratch, as against making small additions to the program directly as a programmer would. There are plenty of program generators around on larger machines, and have been for some time, but these are always used as programmer's tools, to take the drudgery out of performing the tedious tasks that always occur in writing a large application. Program generators on micros can certainly play the same role, but don't make the mistake of thinking that they replace the requirement for skill and understanding of the hardware and the task in hand.

A good high-level language can be used to achieve almost anything a micro is capable of, and a good program generator can speed up the programmer's job of writing applications, but surely the user won't want to slog through the same old menu screens every time he wants to create a new program, or even amend an old one? You still need to know why you are doing what you're doing, or else produce programs suitable only for parrots!

# WRITE PROGRAMS

## Redundant programmers?

"Won't this make programmers redundant?" Well, what is a programmer? In real terms he is the guy who enters code to a pre-set format, using routines he's used a thousand times before, following a specification laid down by a systems analyst – but using his imagination and creative skills to improve, adapt, innovate and above all create elegant program code that works as quickly and efficiently as possible. There is no way that an automated process can replicate these skills unless it has recourse to the same well of knowledge that the experienced human programmer uses all the time. Undoubtedly, in some future time, the heuristic computer will easily perform this job, but 1982 won't see it on your table-top!

If you sit down and take a look at the areas in which micros are used, they probably fall into the following broad categories:- Scientific, Business, Education and Hobby. Neither educationalists nor hobbyists are likely to want to fork out for a program generator when it is far more rewarding and educational to write programs from scratch. (Both these categories are also generally much shorter of funds than the other two!) Scientific users may often also have "business" uses for their micros, but this aside, the tasks performed in research establishments and the like are probably fairly specialised, and require suitably specialised programming, often in machine code. This leaves by far the largest market area for the program generator – "business".

Commercial applications can also be generalised into four sub-categories as follows (although the 1% who use their machines for more esoteric tasks may be insulted at being left out!):- (1) Book-keeping – ledgers, invoicing, payroll, etc. (2) Financial modelling – VisiCalc and friends. (3) Word Processing. (4) Record-keeping – stock control, personnel files, service records, mailing addresses, and so on. The book-keeping tasks are by their very nature highly standardised – everyone has to do their payroll in much the same way, for instance – so the many off-the-shelf packages available on virtually every micro will nearly always do the job. Financial modelling is well catered for, with programs like VisiCalc, MicroModeller and MARS providing a wide spectrum of facilities for every budding gnome. Word Processing is a favourite micro application and has already threatened the older-established dedicated machines, so there's no room there for innovation either.

This leaves only the record-keeping tasks,

historically the area where most users require tailoring of programs or bespoke applications to be written, usually without realising that their requirements are in principal very similar to Fred next door, just with different labels on the boxes! Any computer with a disk and printer attached is good at storing data in records and pulling it back again by selective criteria and printing the results. What really matters is how understandable this process is to the operator and how flexible the program is that does it.

## Murphy's Law

If you decide that you want a name and address file for mailing your customers with new products from time to time, then you have to decide how much information you are going to store, and by which parameters you are going to want to retrieve that data. Murphy says that six months later, after you've entered fourteen thousand names, you decide you also need to store the customers' telephone number, which you forgot to specify to the software house that wrote the program (you will recognise that this never happens in real life, of course). The result is a costly bill for altering the program, and either an awful lot of re-typing or another bill for converting the old data file into the new format. This is where a program generator could be used, providing that you, the user, appreciate the risks involved in dipping your toes into the cold water of program design! Given sufficient enthusiasm and hard graft, the results could be very gratifying, especially if you're the sort of person who changes your mind every other week on the type of system you want!

There are several programs which perform an essentially similar task to the program generators, although in some cases a far more satisfactory way, and without claiming to be anything more than sophisticated database programs. Silicon Office, for example, provides more facilities than any of the program generators, but does not claim to do away with programmers! However, let's take a brief look at some of the code generators on the market.

## Marketing strategy

The Last One must be the first to be mentioned, in deference to the marketing strategy employed (undoubtedly inspired by the Sirius Cybernetics Corporation of Betelgeuse 5) which made this the most widely-advertised computer program ever. Unfortunately, this doesn't make it unique, as you will have gathered that this type of program has

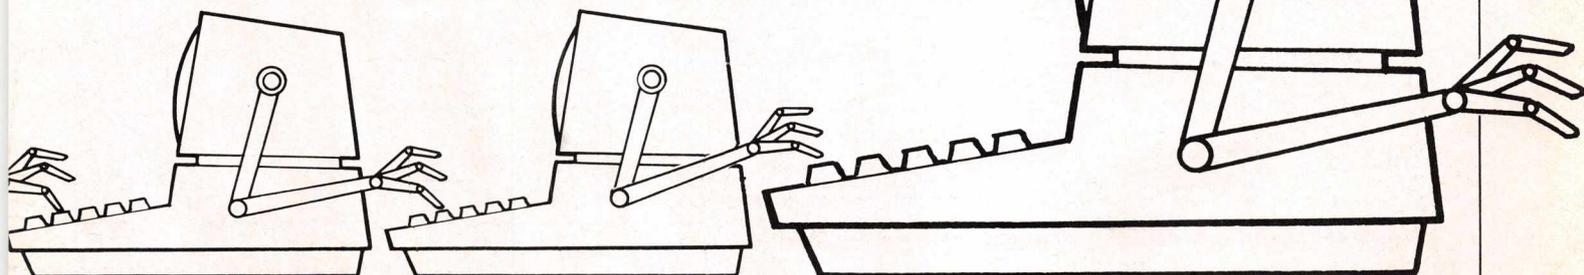

been around on mainframes for years, albeit in not quite the same style. The code generated is in BASIC. The Last One, from D.J. 'Al' Systems Limited, is apparently available on quite a number of micros, although it was developed on an Ohio Scientific, and Ohio are now supplying it as standard on their machines. Price: £260.00 + VAT from many micro dealers.

Nucleus, from Compact Accounting Services Limited, is marketed on a slightly lower profile, and is available for CP/M machines and the Rank Xerox 820, also generating code in BASIC. Priced at £1,000.00 + VAT it is available only from the authors. Compact also supply a different version of Nucleus for the Adds Multivision system, which is again priced at £1,000.00.

Forms-2 is another CP/M program, this time from Micro Focus Limited, and generating its programs in CIS COBOL. It is also available for the Apple II, and is sold through dealers and distributors for many 8080, Z80 and LSI-11 systems. The marketing for this product is very realistic when compared with many of its rivals, with comments like "FORMS-2 ... is a COBOL source code generator to help you build interactive applications with ease." Price: £100.00 + VAT.

## Micro fad

There is also Genesis, Pearl, Quickpro (from The Software House), and CORP (from the unlikely named Maromaty and Scotto Corporation!) No doubt readers will soon be writing in with more and more names of program generators, and we will be playing spot the press release on an almost daily basis. However, just like every other micro fad, the market will eventually settle down, and those that are still around will, by definition, be the ones that work and are actually useful. In the mean time, it doesn't seem terribly likely that the unemployment queues will be filling with destitute programmers, nor that everyone will suddenly stop writing standard applications.

# PROGRAM GENERATOR

Our PEARL is simply the best Program Generator  
written specifically for CPM in the UK today.

During the last twelve months over 1000 users  
have had the benefit of PEARL.

We'd like to tell you more.

PEARL INFORMATION DESK, Computer Pathways United Limited, Crown House, Gipsy Hill, SE19 1NL.

# Connect your PET to a PRINTER from £160 + VAT

The **TNW 2000** (as illustrated) a rugged single ported bi-directional IEEE 488/RS232 interface:

- Conversion of both PET and true ASC11.
- Daisy Chaining.
- Standard RS 232.
- Fully addressable.

The **TNW 3000** – a bi-ported, bi-directional IEEE 488/RS232 interface as per TNW 2000 plus:

- Crystal controlled Baud rate.
- Fully implemented RS232.
- Power supply for a current loop.

Both the TNW 2000 and 3000 are mainly used for interfacing PET's to printers.

# Hard Disks for the PET

The Small Systems **HARDBOX** acts as an intelligent controller for up to 4 Corvus Winchester drives or one SSE Mini Winchester drive unit.

- PET DOS 1 and 2 compatibility
- Multi user capability on Corvus Drives
- 16 Megabyte max file size
- 65535 max records per relative file
- Over 2000 files on 5 MB drive

## CORVUS DRIVES

Well proven systems with nationwide support and maintenance.

- 5, 10, 20MB capacity
- Up to 4 drives can be daisy chained
- Backup onto standard video cassette using the Mirror unit
- Up to 64 users with the Constellation multiplexer unit.

5MB Corvus drive	£2295
10MB	£3595
20MB	£4495
Mirror back up unit	£495
Constellation	£495

## SSE MINI WINCHESTER

Drive and Hardbox or Softbox housed in one small desktop unit. Single user.

Prices inc. Integral Hardbox	
3MB	£2300
6MB	£2500
12MB	£2800

Add £120 for Integral Softbox

## SOFTBOX and CP/M SOFTWARE

**SOFTBOX** allows the PET to run the worlds most popular operating system for micros. Operates with PET floppies and/or a Hard disk system.

Comprehensive range of CP/M software available - ask for our Catalogue.

Softbox	£550
RS232 Option	£45
Corvus Option	£65

## IEEE-488 INTERFACES

Comprehensive range for PET and HP-85 e.g. B300 RS232 Bi-directional 40 char buffer, full hand shake £186

## RICOH DAISY WHEEL PRINTERS

Letter quality, 60CPS with integral IEEE, RS232 or Centronics Interfaces.

RP1600	£1450
Flowriter	£1795
Large Buffer. Qume/Diablo compatible	
Bidirectional printing	

## S100-CP/M SOFTWARE DEVELOPMENT TOOLS FOR INDUSTRY

8048 family in circuit emulator	£550
8748 programmer	£395
Prom emulator	£295
Range of cross assemblers for most popular micros	£95
8048 BASIC compiler	£195

# INSIDE TRADER

Following the *Commodore's* successful prosecution of his lawsuit against PET designer, *Chuck Peddle*, I am intrigued by the specification of the secret new Commodore 128 and 256 revealed in *Hotline*. These bear more than a passing resemblance to Peddle's own Sirius 1, which they undercut. Perhaps readers can enlighten me as to the significance of the designation 'Project Peddlebuster'?

*Thirty years after writing his acclaimed I. Robot, Isaac Asimov, doyen of science fiction writers, has finally got around to tinkering with his own computer. It is a TRS-80 Model II, which for reasons best known to themselves, Tandy dumped on his doorstep one day. Unfortunately, whenever Asimov types English into it, the Trash-80 responds with ?SYNTAX ERROR. Perhaps, he muses, his next project will be a rationalisation of the English language to remove illogical inconsistencies. I start to tell him about BASIC but the great man isn't listening.*

With April first imminent what revolutionary ramps has red-under-the-bed, *Duncan Campbell* in store for us? Last year's 'Government-computers-are-transcribing-your-telephone-calls' myth still rolls merrily on, a spirited defence being mounted as late as last month by *Personal Computer World's Guy Kewney*. Unfortunately, Red Dunc omitted to advise his pal G.K. of the practical nature of the joke ....

*Apple executives, Harvard Business School graduates to a man, have been congratulating themselves on the terms extracted from the Irish Government in return for siting their European factory in the Republic. The juiciest concession was a promise that Government Ministries would standardise on Apple. Now the Irish Education Board are on the point of buying a large quantity of Osborne's briefcase computers. By coincidence Osborne are looking for a European factory site.*

The cover of the new **VIC** manual shows one of those impossibly clean cut American families gathered round said computer gazing in awe at the graphics on the screen. As well they might. The power supply is clearly shown to be disconnected.

*Micro magazines often have to take turns reviewing a preproduction model of a new computer. Thus it was that an early Sirius 1 was to be seen riding Practical Computing-wards in a cab charged to Personal Computer World's account. P.C. staff were astonished to see their usually bicycle-bound editor, Peter Laurie riding round in the same cab for the next four days. PCW should be getting the bill about now.*

You will shortly be reading sundry celebrations of Tandy's cleverness in piggybacking a 16-bit 68000 board onto the back of the TRS-80 Model II. This board's close resemblance to one manufactured by the small Californian firm of **Digital Acoustics** is completely coincidental. Serves D.A. right for publishing the circuit details in issue No.4 of their newsletter.

*Apple III has a monitor in ROM. Like the PET. What's newsworthy about that? Not a lot, except that you won't find it mentioned in the literature, and the company play distinctly tight-lipped dumb when asked. To get into the monitor, hold down Reset and press one other key. To make it more interesting I won't tell you which one, since pressing the wrong key can cause spectacular damage. Try it at a show.*

# Make the most of your Sinclair ZX Computer...

# Sinclair ZX software on cassette.

## £3.<sup>95</sup> per cassette.

The unprecedented popularity of the ZX Series of Sinclair Personal Computers has generated a large volume of programs written by users.

Sinclair has undertaken to publish the most elegant of these on pre-recorded cassettes. Each program is carefully vetted for interest and quality, and then grouped with other programs to form a single-subject cassette.

Each cassette costs £3.95 (including VAT and p&p) and comes complete with full instructions.

Although primarily designed for the Sinclair ZX81, many of the cassettes are suitable for running on a Sinclair ZX80—if fitted with a replacement 8K BASIC ROM.

Some of the more elaborate programs can be run only on a Sinclair ZX Personal Computer augmented by a 16K-byte add-on RAM pack.

This RAM pack and the replacement ROM are described below. And the description of each cassette makes it clear what hardware is required.

### 8K BASIC ROM

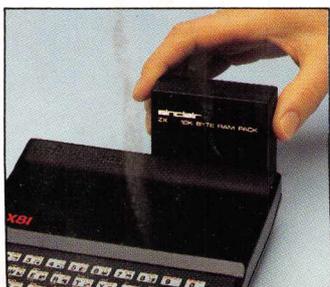

The 8K BASIC ROM used in the ZX81 is available to ZX80 owners as a drop-in replacement chip. With the exception of animated graphics, all the advanced features of the ZX81 are now available on a ZX80—including the ability to run much of the Sinclair ZX Software.

The ROM chip comes with a new keyboard template, which can be overlaid on the existing keyboard in minutes, and a new operating manual.

### 16K-BYTE RAM pack

The 16K-byte RAM pack provides 16-times more memory in one complete module. Compatible with the ZX81 and the ZX80, it can be used for program storage or as a database.

The RAM pack simply plugs into the existing expansion port on the rear of a Sinclair ZX Personal Computer.

### Cassette 1—Games

For ZX81 (and ZX80 with 8K BASIC ROM)

**ORBIT**—your space craft's mission is to pick up a very valuable cargo that's in orbit around a star.

**SNIPER**—you're surrounded by 40 of the enemy. How quickly can you spot and shoot them when they appear?

**METEORS**—your starship is cruising through space when you meet a meteor storm. How long can you dodge the deadly danger?

**LIFE**—J. H. Conway's 'Game of Life' has achieved tremendous popularity in the computing world. Study the life, death and evolution patterns of cells.

**WOLFPACK**—your naval destroyer is on a submarine hunt. The depth charges are armed, but must be fired with precision.

**GOLF**—what's your handicap? It's a tricky course but you control the strength of your shots.

### Cassette 2—Junior Education: 7-11-year-olds

For ZX81 with 16K RAM pack

**CRASH**—simple addition—with the added attraction of a car crash if you get it wrong.

**MULTIPLY**—long multiplication with five levels of difficulty. If the answer's wrong—the solution is explained.

**TRAIN**—multiplication tests against the computer. The winner's train reaches the station first.

**FRACTIONS**—fractions explained at three levels of difficulty. A ten-question test completes the program.

**ADDSUB**—addition and subtraction with three levels of difficulty. Again, wrong answers are followed by an explanation.

**DIVISION**—with five levels of difficulty. Mistakes are explained graphically, and a running score is displayed.

**SPELLING**—up to 500 words over five levels of difficulty. You can even change the words yourself.

### Cassette 3—Business and Household

For ZX81 (and ZX80 with 8K BASIC ROM) with 16K RAM pack

**TELEPHONE**—set up your own computerised telephone directory and address book. Changes, additions and deletions of up to 50 entries are easy.

**NOTE PAD**—a powerful, easy-to-run system for storing and

retrieving everyday information. Use it as a diary, a catalogue, a reminder system, or a directory.

**BANK ACCOUNT**—a sophisticated financial recording system with comprehensive documentation. Use it at home to keep track of 'where the money goes,' and at work for expenses, departmental budgets, etc.

### Cassette 4—Games

For ZX81 (and ZX80 with 8K BASIC ROM) and 16K RAM pack

**LUNAR LANDING**—bring the lunar module down from orbit to a soft landing. You control attitude and orbital direction—but watch the fuel gauge! The screen displays your flight status—digitally and graphically.

**TWENTYONE**—a dice version of Blackjack.

**COMBAT**—you're on a suicide space mission. You have only 12 missiles but the aliens have unlimited strength. Can you take 12 of them with you?

**SUBSTRIKE**—on patrol, your frigate detects a pack of 10 enemy subs. Can you depth-charge them before they torpedo you?

**CODEBREAKER**—the computer thinks of a 4-digit number which you have to guess in up to 10 tries. The logical approach is best!

**MAYDAY**—in answer to a distress call, you've narrowed down the search area to 343 cubic kilometers of deep space. Can you find the astronaut before his life-support system fails in 10 hours time?

### Cassette 5—Junior Education: 9-11-year-olds

For ZX81 (and ZX80 with 8K BASIC ROM)

**MATHS**—tests arithmetic with three levels of difficulty, and gives your score out of 10.

**BALANCE**—tests understanding of levers/fulcrum theory with a series of graphic examples.

**VOLUMES**—'yes' or 'no' answers from the computer to a series of cube volume calculations.

**AVERAGES**—what's the average height of your class? The average shoe size of your family? The average pocket money of your friends? The computer plots a bar chart, and distinguishes MEAN from MEDIAN.

**BASES**—convert from decimal (base 10) to other bases of your choice in the range 2 to 9.

**TEMP**—Volumes, temperatures—and their combinations.

### How to order

Simply use the order form below, and either enclose a cheque or give us the number of your Access, Barclaycard or Trustcard account. Please allow 28 days for delivery. 14-day money-back option.

## Sinclair ZX SOFTWARE

Sinclair Research Ltd,  
6 Kings Parade, Cambridge,  
Cambs., CB21SN. Tel: 0276 66104.

To: Sinclair Research, FREEPOST, Camberley, Surrey, GU15 3BR. Please print  
Please send me the items I have indicated below.

Qty	Code	Item	Item price	Total
	21	Cassette 1—Games	£3.95

# SEEING IS BELIEVING

# ACT SIRIUS 1

# NEW ACT SIRIUS 1

## Minicomputer Performance. Personal Computer Price.

### 16 bit processor: £2,395

**The best price/performance ratio you've ever seen on a personal computer.**

	ACT Sirius 1	Typical Personal Computers	Typical Business Systems
Memory	128K-1024K	32K-64K	48K-256K
Disk Capacity	1.2Mb-10 Mb	140K-1Mb	1.2Mb-10 Mb
Processor	16 bit	8 bit	8 bit
Operating Systems	CP/M-86, MSDOS	CP/M or Machine Specific	Usually Machine Specific
Languages	Microsoft BASIC Compiled BASIC COBOL PASCAL FORTRAN	Microsoft BASIC perhaps one or two others, eg PASCAL	BASIC and perhaps one or two others
Price	£2395	£1800-£3000	£4500-£8500

ACT Sirius 1 is a new generation personal computer. Quite simply, it has no competition at the price.

It's the first personal computer developed from the outset for business and professional use.

It's launched with more software than anything before it.

It's supported and distributed solely by ACT — the biggest name in personal computer software.

And it's developed by Chuck Peddle, formerly of Commodore and generally regarded as the father of personal computing.

### SOFTWARE SPELLS SUCCESS

ACT Sirius 1 has more software than any other new personal computer:

A choice of two operating systems — CP/M-86 or MSDOS, from Microsoft.

### For Software Houses

The ACT Sirius 1 has a language for you. Microsoft BASIC 80, two BASIC Compilers, two COBOLS, PASCAL and FORTRAN.

### For Applications

Wordstar, Mailmerge, Pulsar, SuperCalc and MicroModeller — all the best sellers.

And the ACT Sirius 1 can run any software written for CP/M — that means hundreds of specialised packages.

### THE BODY IN QUESTION

Ergonomics play a vital part in the design of ACT's Sirius 1.

The screen tilts and swivels to suit the user and glare is eliminated.

The display is razor sharp; and the brilliance and contrast can be adjusted using keys on the low-profile detachable keyboard.

### STAYING OUT IN FRONT

The ACT Sirius 1 is designed to keep you out in front. Winchester, networks, multi-user facilities and colour graphics are all scheduled during the next twelve months. And all at the same record-breaking price levels of the ACT Sirius 1.

### SEEING IS BELIEVING

The ACT Sirius 1 goes through the most exhaustive quality control process of any microcomputer — including the much vaunted Japanese products.

ACT Sirius 1 has been successfully operating in testing field trials for over 6 months already. And now it's at your nearest ACT Dealer — ready to revolutionise your ideas on personal computers.

Clip the coupon for literature. Better still, call David Low now on the hot line 021-454 8585, get the name of your nearest dealer and see a demonstration as soon as you can — because seeing is believing.

To: ACT (Microsoft) Ltd, FREEPOST,  
Birmingham B16 8BR.

- Please send a brochure and name of my nearest dealer
- I am interested in dealership — send the dealer pack and ask your sales director to contact me.

# THIS SHOULD BE THE ONLY MEMORY BOARD YOU WILL EVER NEED FOR YOUR VIC!

**£49 +VAT**

### Features of the board include:

- 1 3K Memory hi-resolution area
  - 2 24K Expansion area, just plug in the chips to expand memory!
  - 3 Socket for VicKit or other Roms.
  - 4 Provision for battery back-up
  - 5 Memory port reproduced
  - 6 High quality gold plated edge, plated thro' hole, glass fibre board
  - 7 Switch to isolate 3K memory area
- (Board shown with covers removed)

**Supplied Complete with Covers —**

**NO NEED FOR A MOTHERBOARD OR EXPANSION CHASSIS**

**BUY THE BOARD WITH THE MEMORY YOU NEED NOW!  
EXPAND IT LATER! ADD TOOLKIT!  
ADD BATTERY BACK-UP NOTHING REDUNDANT!  
NOTHING WASTED!**

**SPECIAL INTRODUCTORY PRICE Only £64.00**

**Fully socketed board (with covers) plus 3K hi-res area memory plus VicKit (Toolkit for Vic)**

*This offer is available until 31st May 1982 and is subject to VAT at 15% plus £1.50 p&p.*

### PRICES:-

BOARD with 3K	<b>£49.00</b>
BOARD with 8K	<b>£69.00</b>
BOARD with 8K plus 3K	<b>£85.00</b>
BOARD with 16K	<b>£99.00</b>
BOARD with 16K plus 3K	<b>£115.00</b>
BOARD with 24K	<b>£129.00</b>
BOARD with 24K plus 3K	<b>£145.00</b>

**SPECIAL**  
Add £15 plus VAT for  
**VICKIT (Vic toolkit)**  
if ordered with any memory  
usually £25 plus VAT  
if supplied separately.

### Additional Memory

8K (4 chips)	<b>£39.00</b>
3K (2 chips)	<b>£20.00</b>
Battery support kit	<b>£20.00</b>
